“Promoting Vaccine Confidence: Enhancing Global Immunization Efforts to Protect the Health of All Generations”

Background: Immunization is one of the great public health achievements. As public health officials, our role advancing the health of people must include championing immunization against vaccine preventable diseases and the development of new vaccines against disease threats which are not currently vaccine preventable. Vaccinations are a core part of a healthy life protecting infants, children, adolescents, and adults from preventable disease, and are vital to achieving and sustaining public health gains. One of the most cost effective public health interventions, vaccination currently prevents 2-3 million deaths per year, serves as a powerful tool for poverty protection, and is our most reliable front-line defense against infectious disease.

In 2017, the world has reached a historical landmark- 116.2 million children vaccinated - the highest figure ever attained. Despite the optimism this number inspires, global immunization coverage (proportion of children in the world receiving recommended vaccines) remains stable in the last years, at around 85%. Despite profound global successes, including the historic eradication of small pox and widespread prevention of serious infections including diphtheria, tetanus, polio, measles, rubella and other communicable diseases, vaccination has become the victim of its own success. The progress we have made is threatened by complacency coupled with misunderstanding and misinformation about vaccines has undermined public trust, resulting in outbreaks of vaccine-preventable diseases among communities or individuals who have decided to delay a decision to vaccinate or decided not to vaccinate despite the availability of vaccines and vaccination services. One in 10 children globally do not receive any vaccines. Building and maintaining demand for immunizations is a fundamental element of primary health care and requires improving community engagement as an essential component of vaccination programs.

Modern vaccines are highly effective and safe; mild reactions are short-lived, and serious side effects are exceptionally rare, and much less serious than the life-threatening consequences of actual disease Vaccines hesitancy – including the indecision, delay or refusal to vaccinate despite the availability of vaccination services – threatens to reverse progress made over decades against vaccine preventable diseases, causing backsliding on the control of these diseases, and hinder uptake of new immunizations for diseases without such prevention measures currently. While the reasons for the rise in vaccine hesitancy are complex, lack of confidence in vaccines and the system that develops, approves, recommends and delivers them are key drivers. Given the benefits, understanding and addressing the root causes of vaccine hesitancy at the community level needs to be integrated into our strategy if we are to achieve the full promise of vaccination to prevent outbreaks, save lives, secure health, advance economic prosperity, and provide a global safety net against these diseases.

Event: A panel will discuss evidence-based understanding of global vaccine acceptance and demand and the social, and the social and economic benefits of vaccines. Speakers will describe past and current efforts to promote vaccine confidence, improve access to vaccine and service delivery, and promote positive, accurate information about vaccines among parents, community leaders, and policymakers/legislators. This side event will allow Member States to share experiences with building resilient vaccination programs, program successes, and addressing the challenges to demand for vaccinations. It will raise awareness of current challenges and present strategies to improve vaccination coverage. The event will raise...
awareness of the need for global, regional and national focus on vaccine confidence as part of effective vaccination programming through community engagement and other approaches toward continued progress against vaccine preventable diseases.

Objectives

1. Enhance the understanding that immunization is a fundamental element of Primary Health Care, a first step in the direction of guaranteeing access of communities to health services and central to the advancement towards Universal Health Coverage.

2. Describe successes in global prevention and/or elimination of vaccine preventable diseases globally and identify good health practices related to improving vaccination coverage, including through The Decade of Vaccines. Discuss recent trends in decreased vaccination rates in global settings and resulting increases in related outbreak/incidence data and implications for the vision and strategy being developed for the post-2020 agenda.

3. Explore how to understand better the behavioral drivers of vaccine confidence to increase vaccination coverage, avoid new outbreaks of vaccine preventable diseases or resurgence of vaccine preventable diseases with low incidence or already eliminated.

4. Galvanize support for redoubled prioritization of immunization by Member States and the need to negotiate the commitments and fully implement the Global Vaccine Action Plan and the developing post-2020 agenda and strengthen national action plans, including focusing on vaccine confidence.

Event panelists will include Health Ministers from co-sponsoring countries, WHO, senior leaders from other relevant ministries from different regions of WHO, and senior subject matter experts (government and nongovernmental) thus promoting a multi-sectoral approach to the discussions. We anticipate that the presentations and discussion at this side event will expand participants’ awareness of progress and challenges on vaccine coverage rates and the serious implications of backsliding, and obtaining and sustaining high vaccination coverage.

Proposed Program Overview (Total Time 90 Minutes)
Facilitator: Senior HHS/Co-sponsor representative

- **Welcome and introduction** – 5 minutes (HHS leadership and senior European Commission and Brazilian representative)
- **Challenges for vaccination worldwide** – 15 minutes (scene-setting by thought leader followed by senior leaders from co-sponsoring countries (Brazil, EC, Romania, U.S.)
- **State of the Globe: The role of misinformation in reducing vaccine confidence** – 15 minutes (senior leaders from co-sponsoring countries, WHO representative)
- **Refresh and Revamp: Revitalizing Information and Education on Vaccination** – 20 minutes (senior leaders from co-sponsoring countries, non-governmental thought leader)
- **Discussion** – 25 minutes (all)
- **Conclusion** – 5 minutes (Co-sponsoring country leadership)
