Priority life-saving medicines for women and children

2012

Improving maternal and child health is a global priority. An estimated 7.6 million children under the age of five die every year and an estimated 1 000 women – most of them in developing countries—die every day due to complications related to pregnancy or childbirth. Many of these deaths are due to conditions that could be prevented or treated with access to simple, affordable vaccines, contraceptives and medicines. However, the availability of medicines at public-health facilities is often poor.

**IMPROVING HEALTH AND SAVING LIVES BY ENSURING ACCESS TO PRIORITY MEDICINES**

This list of priority life-saving medicines for women and children was developed by the World Health Organization departments of Essential Medicines and Health Products; Maternal, Newborn, Child and Adolescent Health; and Reproductive Health and Research, and UNFPA and UNICEF to help countries and partners select and make available those medicines that will have the biggest impact on reducing maternal, newborn and child morbidity and mortality.

The medicines on this list were chosen according to 1) the global burden of disease; 2) the evidence of efficacy and safety for preventing or treating major causes of sexual and reproductive, maternal, newborn and child mortality and morbidity. In addition, medicines were included for palliative care. All of the medicines listed are included in the current versions of the WHO Model List of Essential Medicines (EML), the WHO EML for Children (with the exception of dexamethasone and betamethasone) and WHO treatment guidelines. Medicines were selected from the core essential medicines list with one exception, to prioritize those medicines that can be used throughout health care systems.

The *Priority medicines for mothers and children* 2011 list was updated following the 18th Expert Committee Meeting on Selection and Use of Medicines, the release of new treatment guidelines and feedback from partners following the 2011 version. In alignment with the UN Global strategy for women’s and children’s health; and the recently launched UN Commission on life-saving commodities for women and children, the title of this updated list is renamed as *Priority Life-Saving Medicines for Women and Children*.

Updates to the list of priority life-saving medicines for mothers include: the addition of misoprostol for the prevention of post-partum haemorrhage; the additions of hydralazine and methyldopa for the treatment of severe pregnancy-induced hypertension and the removal of the 2-ml vial of magnesium sulfate; the addition of misoprostol and mifepristone for the provision of safe abortion services; the addition of tetanus vaccine for the prevention of tetanus in mothers and children; and the addition of contraceptives. Procaine benzylpenicillin was removed from the list of medicines for treatment of pneumonia in children; higher dosage forms for neonatal sepsis were removed; an explanatory note on the gentamicin formulation was added and a referral to guidance on vaccines was made. The list of *priority medicines required for child health and survival, but for which further research and development is needed* was removed from this update to reflect the need to advocate separately for these medicines.

**Priority life-saving medicines for children under five years of age**

**Pneumonia**¹,²,³
Pneumonia is the single biggest cause of death in children, killing an estimated 1.4 million children under the age of five years annually and accounting for 18% of all deaths of children under five years old worldwide.

- **Amoxicillin:** dispersible, scored tablets 250 mg and 500 mg or equivalent flexible oral solid dosage form, in blister packs of 10
- **Ampicillin:** powder for injection 500 mg and 1g
- **Ceftriaxone:** powder for injection 250 mg and 1 g
- **Gentamicin:** injection 40 mg/ml; 20 mg/ml
- **Oxygen:** medicinal gas

**Diarrhoea**⁴
Diarrhoeal disease is the second leading cause of death and a leading cause of malnutrition in children under five years old, killing more than 1.2 million children every year.

- **Oral rehydration salts (ORS):**³ sachets of 200 ml; 500 ml and 1 litre, appropriate flavour
- **Zinc:** 20 mg scored dispersible tablet or equivalent flexible oral solid dosage form

**Malaria**³⁰
Every minute a child dies of malaria in Africa. In 2010, there were 247 million cases of malaria and 600 000 deaths – mostly among children living in Africa.

- **Artemisinin combination therapy (ACT):** strengths and combinations according to WHO treatment guidelines 2010, dispersible tablet or flexible oral solid dosage form and dose optimized
- **Artesunate:** rectal and injection dosage forms 50–200 mg

**Neonatal sepsis**⁵
One quarter of the estimated 3.1 million neonatal deaths around the world each year are caused by severe infections, and around 457 000 of those are due to neonatal sepsis alone.

- **Ampicillin:** powder for injection 250 mg and 500 mg
- **Ceftriaxone:** powder for injection 250 mg and 500 mg
- **Gentamicin:** injection 40 mg/ml; 20 mg/ml
- **Procaaine benzylpenicillin:** powder for injection 1 g (not recommended as first-line treatment except in cases where hospital care is not achievable in high neonatal mortality settings)

**HIV**⁶,⁷,⁸
An estimated 2.1 million children were living with HIV at the end of 2008, 1.8 million of them in sub-Saharan Africa. Most infections are the result of transmission from mother to child. Without effective treatment, an estimated one third of infected infants will have died by one year of age, and about half will have died by two years of age.

- **Standard regimen for first-line antiretroviral treatment:**
  - 1 non-nucleoside reverse transcriptase inhibitor plus 2 nucleoside reverse transcriptase inhibitors such as the fixed-dose combination of lamivudine + nevirapine + zidovudine — tablet 30 mg + 50 mg + 60 mg; 150 mg + 200 mg + 300 mg
  - For treatment of specific populations, see the latest WHO treatment guidelines

**Vitamin A deficiency**⁹
Vitamin A deficiency is a recognized risk factor for severe measles. An estimated 76 000 children under five years died from measles in 2010.

- **Vitamin A:** capsule 100 000 IU strength; 200 000 IU strength

**Palliative care and pain**¹⁰
Although means to relieve severe pain are widely available, their use in children is often limited.

- **Morphine:** granules 20 mg, 30 mg, 60 mg, 100 mg, 200 mg; injection 10 mg/ml, oral liquid 10 mg/5 ml, variable flexible oral solid dosage forms
- **Paracetamol:** variable flexible oral solid dosage forms

**Vaccines**¹¹
In 2008, WHO estimated that 1.5 million of deaths among children under five years were due to diseases that could have been prevented by routine vaccination.

- See WHO guidelines¹²,¹³

---

¹ Gentamicin 40 mg/ml is an adult formulation, adaptable to older children but unsuitable for neonates. 10 mg/ml is ideal for intravenous administration in neonates but unsuitable for intra-muscular injection in the outpatient setting where many receive care. The 20 mg/ml formulation is ideal for neonates and children, however this is not currently manufactured. Dilutions of the 40 mg/ml formulation will need to be made until that time when the 20 mg/ml formulation is available.

Priority life-saving medicines for women (Continued)

for major causes of sexual and reproductive health related mortality and morbidity

Prevention of tetanus in mother and newborn

Maternal and neonatal tetanus have been among the most common lethal consequences of unclean deliveries and umbilical cord care practices. WHO estimates that in 2008, 59 000 newborns died from neonatal tetanus.

Tetanus vaccine

Oral contraceptives such as ethinylestradiol + levonorgestrel: tablet 30 micrograms + 150 micrograms; levonorgestrel 750 micrograms (pack of 2); Injectable contraceptives such as estradiol cypionate + medroxyprogesterone acetate: injection 5 mg + 25 mg or medroxyprogesterone acetate: depot injection 150 mg/ml in 1-ml vial or norethisterone enantate 200 mg/ml in 1-ml ampoule; Implantable contraceptives such as levonorgestrel-releasing implant: 150 mg total

For intrauterine devices and barrier methods of contraception (e.g. condoms) see WHO EML

Contraception

Family planning through provision of modern contraceptives is one of the most effective strategies for reducing maternal death. Reducing the unmet need for family planning and thus, preventing unintended pregnancies, is estimated to reduce a third of maternal, and up to 10% of infant deaths.
