Introduction

A classification of diseases may be defined as a system of categories to which morbid entities are assigned according to established criteria. There are many possible axes of classification and the one selected will depend upon the use to be made of the statistics to be compiled. A statistical classification of diseases must encompass the entire range of morbid conditions within a manageable number of categories.

The 10th revision of the *International statistical classification of diseases and related health problems* is the latest in a series that was formalized in 1893 as the *Bertillon classification* or *International list of causes of death*. A complete review of the historical background to the classification is given in Volume 2. While the title has been amended to make clearer the content and purpose and to reflect the progressive extension of the scope of the classification beyond diseases and injuries, the familiar abbreviation ‘ICD’ has been retained. In the updated classification, conditions have been grouped in a way that was felt to be most suitable for general epidemiological purposes and the evaluation of health care.

Work on the 10th revision of the ICD started in September 1983 when a Preparatory Meeting on ICD-10 was convened in Geneva. The programme of work was guided by regular meetings of heads of WHO collaborating centres for classification of diseases. Policy guidance was provided by a number of special meetings, including those of the expert committee on the *International classification of diseases – 10th revision*, held in 1984 and 1987.

In addition to the technical contributions provided by many specialist groups and individual experts, a large number of comments and suggestions were received from WHO Member States and regional offices as a result of the global circulation of draft proposals for revision in 1984 and 1986. From the comments received, it was clear that many users wished the ICD to encompass types of data other than the ‘diagnostic information’ (in the broadest sense of the term) that it has always covered. In order to accommodate the perceived needs of these users, the concept arose of a ‘family’ of classifications centred on the traditional ICD with its familiar form and structure. The ICD itself would thus meet the requirement for diagnostic information for general purposes, while a variety of other classifications would be used in conjunction with it and would deal either with different approaches to the same information or with different information (notably medical and surgical procedures and disablement).

Following suggestions at the time of development of the ninth revision of the classification that a different basic structure might better serve the needs of the many and varied users, several alternative models were evaluated. It became clear, however, that the traditional single-variable-axis design of
the classification, and other aspects of its structure that gave emphasis to conditions that were frequent, costly or otherwise of public health importance, had withstood the test of time and that many users would be unhappy with any of the models that had been proposed as a possible replacement.

Consequently, as study of the 10th revision will show, the traditional ICD structure has been retained but an alphanumeric coding scheme replaces the previous numeric one. This provides a larger coding frame and leaves room for future revision without disruption of the numbering system, as has occurred at previous revisions.

In order to make optimum use of the available space, certain disorders of the immune mechanism are included with diseases of the blood and blood-forming organs (Chapter III). New chapters have been created for diseases of the eye and adnexa, and diseases of the ear and mastoid process. The former supplementary classifications of external causes and of factors influencing health status and contact with health services now form part of the main classification.

The dagger and asterisk system of dual classification for certain diagnostic statements, introduced in the ninth revision, has been retained and extended, with the asterisk axis being contained in homogeneous categories at the three-character level.

Content of the three volumes of ICD-10

The presentation of the classification has been changed and there are now three volumes:

**Volume 1. Tabular list.** This contains the Report of the International Conference for the Tenth Revision, the classification itself at the three- and four-character levels, the classification of the morphology of neoplasms, special tabulation lists for mortality and morbidity, definitions, and the nomenclature regulations.

**Volume 2. Instruction manual.** This brings together the notes on certification and classification formerly included in Volume 1, with a good deal of new background and instructional matter and guidance on the use of Volume 1, on tabulations, and on planning for the use of the ICD, which was seen as lacking in earlier revisions. It also includes the historical material formerly presented in the introduction to Volume 1.

**Volume 3. Alphabetical index.** This presents the index itself with an introduction and expanded instructions on its use.

The classification was approved by the International Conference for the Tenth Revision of the International Classification of Diseases in 1989 and adopted by
the Forty-third World Health Assembly in the following resolution:

The periodic revision of the ICD has, since the sixth revision in 1948, been coordinated by the World Health Organization (WHO). As the use of the classification has increased, so, understandably, has the desire among its users to contribute to the revision process. The 10th revision is the product of a vast amount of international activity, cooperation and compromise, and WHO acknowledges with gratitude the contributions of the international and national specialist groups and individuals in numerous many countries.

WHO gratefully acknowledges the important technical contribution of the WHO Collaborating Centre for the Family of International Classifications which is located at the Deutsches Institut für Medizinische Dokumentation und Information (DIMDI) in Cologne, Germany, and, in particular, that of the Head of the Centre Michael Schopen, in the updating of the texts and the preparation of the electronic files that were used for this version of ICD-10.

WHO Collaborating Centres for the Family of International Classifications

Thirteen WHO Collaborating Centres for the Family of International Classifications have been established to assist countries with problems encountered in the development and use of health-related classifications and, in particular, in the use of the ICD.

It is important that countries bring to the attention of the respective centre any significant problems they might encounter in the use of the ICD, and especially when a new disease for which the ICD does not provide a suitable classification is encountered frequently. Until now, the ICD has not been updated between revisions but for ICD-10, through the centres, a mechanism has been introduced to provide suitable codes for new diseases where necessary.

In addition to the official WHO collaborating centres, there are a number of national reference centres and individual users should first consult these, or their appropriate national office, when they encounter problems.

There are three centres for English-language users.

The United Nations, the International Labour Organization and the WHO regional offices sent representatives to participate in the conference, as did the Council for International Organizations of Medical Sciences, and 12 other nongovernmental organizations (NGOs) concerned with cancer registration, the deaf, epidemiology, family medicine, gynaecology and obstetrics, hypertension, health records, preventive and social medicine, neurology, psychiatry, rehabilitation and sexually transmitted diseases.

The Conference was opened by Dr JP Jardel, Assistant Director-General, on behalf of the Director-General. Dr Jardel spoke of the extensive consultations and preparatory work that had gone into the revision proposals and had necessitated a longer than usual interval between revisions. He noted that the 10th revision would have a new title, *International statistical classification of diseases and related health problems*, to emphasize its statistical purpose and reflect the widening of its scope. The convenient abbreviation ICD would, however, be retained. He also mentioned the new alphanumeric coding scheme, which had made it possible to provide a better balance between the content of the chapters and to leave room for future additions and changes, as well as the intention to produce an ICD manual of three-character categories with an alphabetical index for use where the more complex, detailed four-character version would be inappropriate.

The Conference elected the following officers:

Dr RHC Wells, Australia (*Chairman*)
Dr H Bay-Nielsen, Denmark (*Vice-Chairman*)
Dr R Braun, German Democratic Republic (*Vice-Chairman*)
Mr RA Israel, United States of America (*Vice-Chairman*)
Dr R Laurenti, Brazil (*Vice-Chairman*) Dr P Maguin, France (*Rapporteur*)
Ms E Taylor, Canada (*Rapporteur*).

The secretariat of the conference was as follows:

Dr JP Jardel, Assistant Director-General, WHO, Geneva, Switzerland
Dr HR Hapsara, Director, Division of Epidemiological Surveillance and Health Situation and Trend Assessment, WHO, Geneva, Switzerland
Dr JC Alary, Chief Medical Officer, Development of Epidemiological and Health Statistical Services, WHO, Geneva, Switzerland
Dr GR Brämer, Medical Officer, Development of Epidemiological and Health Statistical Services, WHO, Geneva, Switzerland (*Secretary*)
Mr A L’Hours, Technical Officer, Development of Epidemiological and Health Statistical Services, WHO, Geneva, Switzerland
Professor W Jänisch, German Democratic Republic (*Temporary Adviser*)
Mr T Kruse, Denmark (*Temporary Adviser*)
Dr K Kupka, France (*Temporary Adviser*)
Dr J Leowski, Poland (*Temporary Adviser*)
The conference was reminded of the impressive history of a statistical classification that dated back to the eighteenth century. While early revisions of the classification had been concerned only with causes of death, its scope had been extended at the sixth revision in 1948 to include non-fatal diseases. This extension had continued through the ninth revision, with certain innovations being made to meet the statistical needs of widely differing organizations. In addition, at the International Conference for the ninth revision (Geneva, 1975) (1), recommendations had been made and approved for the publication, for trial purposes, of supplementary classifications of procedures in medicine and of impairments, disabilities and handicaps.

2. Review of activities in the preparation of proposals for the Tenth Revision of the ICD

The proposals before the conference were the product of a vast amount of activity at WHO headquarters and around the world. The programme of work had been guided by regular meetings of the heads of WHO Collaborating Centres for Classification of Diseases. Policy guidance had been provided by a number of special meetings and by the Expert Committee on the International Classification of Diseases - Tenth Revision, which met in 1984 (2) and 1987 (3) to make decisions on the direction the work should take and the form of the final proposals.

Extensive preparatory activity had been devoted to a radical review of the suitability of the structure of the ICD, essentially a statistical classification of diseases and other health problems, to serve a wide variety of needs for mortality and health-care data. Ways of stabilizing the coding system to minimize disruption at successive revisions had been investigated, as had the possibility of providing a better balance between the content of the different chapters of the ICD.
Even with a new structure, it was plain that one classification could not cope with
the extremes of the requirements. The concept of a ‘family’ of classifications
had therefore been developed, with the main ICD as the core, covering the
centre ground of needs for traditional mortality and morbidity statistics, while
needs for more detailed, less detailed or different classifications and associated
matters would be dealt with by other members of the family.

Several alternative models for the structure of the ICD had been investigated
by the collaborating centres, but it had been found that each had unsatisfactory
features and none had sufficient advantages over the existing structure to
justify replacing it. Special meetings held to evaluate the ninth revision had
confirmed that, although some potential users found the existing structure of
the ICD unsuitable, there was a large body of satisfied users who considered it
had many inherent strengths, whatever its apparent inconsistencies, and wished
it to continue in its existing form.

Various schemes involving alphanumeric notation had been examined, with
a view to producing a coding frame that would give a better balance to the
chapters and allow sufficient space for future additions and changes without
disrupting the codes.

Decisions made on these matters had paved the way for the preparation of
successive drafts of chapter proposals for the 10th revision. These had twice
been circulated to Member States for comment, as well as being reviewed by
other interested bodies, meetings of centre heads, and the expert committee. A
large number of international professional specialist associations, individual
specialists and experts, other WHO headquarters units and regional offices had
given advice and guidance to the WHO unit responsible for the ICD, and to the
collaborating centres, on the preparation of the proposals and the associated
material placed before the conference. WHO gratefully acknowledged this
assistance.

3. General characteristics and content of the proposed 10th revision of the ICD

The main innovation in the proposals for the 10th revision was the use of an
alphanumeric coding scheme of one letter followed by three numbers at the
four-character level. This had the effect of more than doubling the size of the
coding frame in comparison with the ninth revision and enabled the vast majority
of chapters to be assigned a unique letter or group of letters, each capable of
providing 100 three-character categories. Of the 26 available letters, 25 had
been used, the letter U being left vacant for future additions and changes and for
possible interim classifications to solve difficulties arising at the national and
international level between revisions.
As a matter of policy, some three-character categories had been left vacant for future expansion and revision, with the number varying according to the chapters: those with a primarily anatomical axis of classification had fewer vacant categories, as it was considered that future changes in their content would be more limited in nature.

The ninth revision contained 17 chapters plus two supplementary classifications: the Supplementary Classification of External Causes of Injury and Poisoning (the E code) and the Supplementary Classification of Factors Influencing Health Status and Contact with Health Services (the V code). As recommended by the Preparatory Meeting on the Tenth Revision (Geneva, 1983) (4) and endorsed by subsequent meetings, these two chapters were no longer considered to be supplementary but were included as a part of the core classification.

The order of entry of chapters in the proposals for the 10th revision had originally been the same as in the ninth revision; however, to make effective use of the available space, disorders of the immune mechanism were later included with diseases of the blood and blood-forming organs, whereas in the ninth revision they had been included with endocrine, nutritional and metabolic diseases. The new chapter on ‘Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism’ now followed the ‘Neoplasms’ chapter, with which it shared the letter D.

During the elaboration of early drafts of the chapter on ‘Diseases of the nervous system and sense organs’, it had soon become clear that it would not be possible to accommodate all the required detail under one letter in 100 three-character categories. It had been decided, therefore, to create three separate chapters - ‘Diseases of the nervous system’ having the letter G, and the two chapters on ‘Diseases of the eye and adnexa’ and on ‘Diseases of the ear and mastoid process’ sharing the letter H.

Also, the chapters on ‘Diseases of the genitourinary system’, on ‘Pregnancy, childbirth and the puerperium’, on ‘Certain conditions originating in the perinatal period’, and on ‘Congenital malformations, deformations and chromosomal abnormalities’ had been brought together as contiguous chapters XIV to XVII.

With the inclusion of the former supplementary classifications as part of the core classification and the creation of two new chapters, the total number of chapters in the proposal for the 10th revision had become 21. The titles of some chapters had been amended to give a better indication of their content.

Where radical changes to the ICD had been proposed, field-testing had been appropriate. This had been the case for the following chapters:
V. Mental and behavioural disorders  

XIX. Injury, poisoning and certain other consequences of external causes  

XX. External causes of morbidity and mortality

Chapter II, ‘Neoplasms’, had also been subject to some field-testing, although the changes in its content had been of a minor nature.

Some new features of the proposals for the 10th revision were as follows:

- The exclusion notes at the beginning of each chapter had been expanded to explain the relative hierarchy of chapters, and to make it clear that the ‘special group’ chapters had priority of assignment over the organ or system chapters and that, among the special group chapters, those on ‘Pregnancy, childbirth and the puerperium’ and on ‘Certain conditions originating in the perinatal period’ had priority over the others.

- Also, at the beginning of each chapter an overview was given of the blocks of three-character categories and, where relevant, the asterisk categories; this had been done to clarify the structure of the chapters and to facilitate the use of the asterisk categories.

- The notes in the tabular list applied to all uses of the classification; if a note was appropriate only to morbidity or only to mortality, it was included in the special notes accompanying either the morbidity coding rules or the mortality coding rules.

- The ninth revision had identified a certain number of conditions as being drug-induced; this approach had been continued in drawing up the proposals for the 10th revision, and many such conditions were now separately identified.

An important innovation was the creation, towards the end of certain chapters, of categories for postprocedural disorders. These identified important conditions that constituted a medical care problem in their own right and included such examples as endocrine and metabolic diseases following ablation of an organ and other specific conditions such as postgastrectomy dumping syndrome. Postprocedural conditions that were not specific to a particular body system, including immediate complications such as air embolism and postoperative shock, continued to be classified in the chapter on ‘Injury, poisoning and certain other consequences of external causes’.

Another change was that in the ninth revision, the four-digit titles had often had to be read in conjunction with the three-digit titles, to ascertain the full meaning and intent of the subcategory, whereas in the draft presented to the conference the titles were almost invariably complete and could stand alone.

The dual classification scheme for etiology and manifestation, known as the dagger and asterisk system, introduced in the ninth revision, had been the
subject of a certain amount of criticism. This related mainly to the fact that
the classification frequently contained a mixture of manifestation and other
information at the three- and four-digit levels, with the same diagnostic labels
sometimes appearing under both axes. Also, many considered the system to be
insufficiently comprehensive. To overcome these problems, in the draft for the
10th revision, the asterisk information was contained in 82 homogeneous three-
character categories for optional use. This approach enabled those diagnostic
statements containing information about both a generalized underlying disease
process and a manifestation or complication in a particular organ or site to
receive two codes, allowing retrieval or tabulation according to either axis.

These characteristics of the proposed 10th revision were accepted by the
conference.

Each of the chapters was introduced to the conference, with a presentation on
changes introduced since the ninth revision and some background information
about certain innovations. Some issues related to changes in chapter structure
and content were discussed by the conference and agreement reached on
follow-up and modification by the secretariat.

4. Standards and definitions related to maternal
and child health

The conference considered with interest the recommended definitions, standards
and reporting requirements for the 10th revision with regard to maternal mortality
and to fetal, perinatal, neonatal and infant mortality. These recommendations
were the outcome of a series of special meetings and consultations and were
directed towards improving the comparability of data.

The conference agreed that it was desirable to retain the definitions of live birth
and fetal death as they appeared in the ninth revision.

After some discussion, the conference set up a working party on the subject
of maternal mortality and, on the basis of its recommendations, also agreed to
retain the definition of maternal death as it appeared in the ninth revision.

In order to improve the quality of maternal mortality data and provide alternative
methods of collecting data on deaths during pregnancy or related to it, as well
as to encourage the recording of deaths from obstetric causes occurring more
than 42 days following termination of pregnancy, two additional definitions,
for ‘pregnancy-related deaths’ and ‘late maternal deaths’, were formulated by
the working party. [These are included in the section Definitions, p.1069].
The conference

RECOMMENDED that countries consider the inclusion on death certificates of questions regarding current pregnancy and pregnancy within one year preceding death.

The conference agreed that, since the number of live births was more universally available than the number of total births (live births plus fetal deaths), it should be used as the denominator in the ratios related to maternal mortality [as contained in Volume 2].

With respect to perinatal, neonatal and infant mortality, it was strongly advised that published rates based on birth cohorts should be so identified and differentiated.

The conference confirmed the practice of expressing age in completed units of time and thus designating the first day of life as day zero.

The conference

RECOMMENDED the inclusion, in the manual of the 10th revision of the ICD, of definitions, standards and reporting requirements related to maternal mortality and to fetal, perinatal, neonatal and infant mortality.

5. Coding and selection rules and tabulation lists

5.1. Coding and selection rules for mortality

The conference was informed about a process for review of the selection and modification rules for underlying cause of death and the associated notes, as they appeared in the ninth revision, which had resulted in several recommended changes in the rules and extensive changes to the notes.

The conference

RECOMMENDED that the rules for selection of cause of death for primary mortality tabulation, as they appear in the ninth revision, be replaced in the 10th revision [by those contained in Volume 2].

The conference was further informed that additional notes for use in underlying cause coding and the interpretation of entries of causes of death had been drafted and were being reviewed. As these notes were intended to improve consistency in coding, the conference agreed that they would also be incorporated in the 10th revision.

The conference noted the continued use of multiple-condition coding and analysis in relation to causes of death. It expressed encouragement for such activities, but did not recommend that the 10th revision should contain any particular rules or methods of analysis to be followed.
In considering the international form of medical certificate of cause of death, the expert committee had recognized that the situation of an aging population with a greater proportion of deaths involving multiple disease processes, and the effects of associated therapeutic interventions, tended to increase the number of possible statements between the underlying cause and the direct cause of death: this meant that an increasing number of conditions were being entered on death certificates in many countries. This led the committee to recommend the inclusion of an additional line (d) in Part I of the certificate.

The conference therefore

RECOMMENDED that, where a need has been identified, countries consider the possibility of including an additional line (d) in Part I of the medical certificate of cause of death.

5.2. Coding and selection rules for morbidity

For the first time, the ninth revision contained guidance on recording and coding for morbidity and specifically for the selection of a single condition for presentation of morbidity statistics. Experience gained in the use of the definitions and rules in the ninth revision had proved their usefulness and generated requests for their clarification, for further elaboration regarding the recording of diagnostic information by health-care practitioners, and for more guidance on dealing with specific problem situations.

The conference endorsed the recommendations of the 1975 Revision Conference about the condition to be selected for single-condition analysis of episodes of health care, and its view that, where practicable, multiple-condition coding and analysis should be undertaken to supplement routine statistics. It stressed that the 10th revision should make it clear that much of the guidance was applicable only when the tabulation of a ‘main condition’ for an episode was appropriate and when the concept of an ‘episode’ per se was relevant to the way in which data collection was organized.

The conference accordingly

RECOMMENDED that additional guidance on the recording and coding of morbidity should be included in the 10th Revision, and that the definitions of “main condition” and “other conditions” should be incorporated, together with the modified rules for dealing with obviously incorrectly reported “main condition”. [These are included in Volume 2.]

The conference also

RECOMMENDED that where the “main condition” is subject to the dual classification system provided in the ICD, both the dagger and asterisk codes should be recorded, to permit alternative tabulation by either.
The conference agreed that extensive notes and examples should be added to provide further assistance.

5.3. Lists for tabulation of mortality and morbidity

The conference was informed about difficulties that had arisen in the use of the Basic tabulation list based on the ninth revision and about the activities that had been undertaken, particularly by WHO, to develop new lists for the tabulation and publication of mortality data. In this process it had become apparent that, in many countries, mortality up to the age of 5 years was a more robust indicator than infant mortality, and that it would therefore be preferable to have a list that included infant deaths and deaths of children up to the age of 5 years, rather than a list for infants only.

Two versions of the general mortality list and of the infant and child mortality list had been prepared for consideration by the conference, with the second version including chapter titles and residual items for chapters as necessary.

As some concerns were expressed regarding the mortality lists as presented, a small working party was convened to consider the possible inclusion of some additional items. The report of the working party was accepted by the Conference and is reflected in the mortality lists (see Special tabulation list for mortality and morbidity, p. 1043).

On the topic of lists for the tabulation of morbidity, the conference reviewed both a proposed tabulation list and a model publication list based on chapter titles, with selected items included as examples under each title. Considerable concern was expressed about the applicability of such lists to all morbidity in the broadest sense. There was general agreement that the lists as presented were probably more suited to inpatient morbidity, and it was felt that further efforts should be made to develop lists suitable for other morbidity applications, and also that both mortality and morbidity tabulation lists should be accompanied in the 10th revision by appropriate explanations and instructions on their use.

In light of the concerns raised in the conference and the conclusions of the working party, the conference agreed that the tabulation and publication lists should appear in the 10th revision, while an effort should be made to establish clearer, more descriptive titles for these lists. It was also agreed that, to facilitate the alternative tabulation of asterisk categories, a second version of the morbidity tabulation list should be developed, which included the asterisk categories.
6. Family of classifications

6.1. Concept of the family of classifications

During the preparation of the ninth revision it had already been realized that the ICD alone could not cover all the information required and that only a ‘family’ of disease and health-related classifications would meet the different requirements in public health. Since the late 1970s, therefore, various possible solutions had been envisaged, one of which called for a core classification (ICD) with a series of modules, some hierarchically related and others of a supplementary nature.

After studies and discussions in cooperation with the various collaborating centres, a concept of a family of classifications had been elaborated and subsequently revised by the expert committee in 1987, which had recommended the scheme shown below.
The conference

RECOMMENDED that the concept of the family of disease and health-related classifications should be followed up by WHO.

In order to maintain the integrity of the ICD itself and this family concept, the conference

RECOMMENDED that, in the interests of international comparability, no changes should be made to the content (as indicated by the titles) of the three-character categories and four-character sub-categories of the 10th revision in the preparation of translations or adaptations, except as authorized by WHO. The Secretariat of WHO is responsible for the ICD and acts as central clearing-house for any publication (except national statistical publications) or translation to be derived from it. WHO should be promptly notified about the intention to produce translations and adaptations or other ICD-related classifications.

The conference viewed with interest a presentation of the use and linkage of different members of the ICD family in the medicosocial and multidimensional assessment of the elderly in relation not only to health but also to activities of daily living as well as the social and physical environment. It was demonstrated that effective information could be obtained through use of the ICD and the International classification of impairments, disabilities, and handicaps (ICIDH), and especially through use of the codes from the proposed Chapter XXI of the 10th revision.

6.2. Specialty-based adaptations

The conference was informed about plans for the development of adaptations of the 10th revision in the mental health programme area. Clinical guidelines would accompany a version intended for use by clinicians working in the field of psychiatry; research criteria would be proposed for use in investigations of mental health problems; and multi-axial presentations for use in dealing with childhood disorders and for the classification of adult problems would be developed, as well as a version for use by general practitioners. Compilations of ICD codes relevant to psychiatry and to neurology would also be produced, along the lines of previous publications on this subject.

The Conference also heard about the methods used to ensure that the basic structure and function of the ICD were preserved in the initial development of the application for medical specialists in dentistry and stomatology (ICD-DA) and was informed that a new revision of the ICD-DA linked to the 10th revision was in the final stages of preparation.

A presentation was given on the International classification of diseases for oncology (ICD-O), second edition, a multi-axial classification including both
the topography and morphology of neoplasms. The morphology codes of the ICD-O, which had evolved over a long period of time, had been revised and extensively field-tested. The topography codes of the second edition would be based on categories C00–C80 in the 10th revision and publication would, therefore, await World Health Assembly approval of the 10th revision.

There was agreement on the value of an adaptation in the area of general medical practice and the conference was informed about the willingness of groups working in this area to collaborate with WHO. In respect of other specialty-based adaptations, which were likely to become more numerous, the recommended role of WHO as a clearing-house was considered to be extremely important.

6.3. Information support to primary health care

In accordance with the recommendations of the 1975 Revision Conference, a working group had been convened by the WHO Regional Office for South-East Asia in Delhi in 1976. It had drawn up a detailed list of symptom associations and, from this, two short lists were derived, one for causes of death and one for reasons for contact with health services. Field trials of this system had been carried out in countries of the region and the results used to revise the list of symptom associations and the reporting forms. This revised version had been published by WHO in 1978, in the booklet Lay reporting of health information (6).

The Global strategy for health for all by the year 2000 (7), launched in 1978, had raised a number of challenges for the development of information systems in Member States. At the International Conference on Health Statistics for the Year 2000 (Bellagio, Italy, 1982) (8), the integration of ‘lay reporting’ information with other information generated and used for health management purposes had been identified as a major problem inhibiting the wider implementation of lay reporting schemes. The Consultation on primary care classifications (Geneva, 1985) (9) had stressed the need for an approach that could unify information support, health service management and community services through information based on lay reporting in the expanded sense of community-based information.

The conference was informed about the experience of countries in developing and applying community-based health information that covered health problems and needs, related risk factors and resources. It supported the concept of developing non-conventional methods at the community level as a method of filling information gaps in individual countries and strengthening their information systems. It was stressed that, for both developed and developing countries, such methods or systems should be developed locally and that, because of factors such as morbidity patterns, as well as language and cultural variations, transfer to other areas or countries should not be attempted.
6.4. Impairments, disabilities and handicaps

The *International classification of impairments, disabilities, and handicaps* (ICIDH) (5) had been published by WHO in English in 1980 for trial purposes, in accordance with the recommendations of the 1975 revision conference and resolution WHA29.35 (10) of the 1976 World Health Assembly. Since that time, research and development on the classification had followed a number of paths.

The major definitions of the three elements – impairment, disability and handicap – had undoubtedly been instrumental in changing attitudes to disablement. The definition of ‘impairment’, an area where there was considerable overlap with the terms included in the ICD, had been widely accepted. The definition of ‘disability’ broadly matched the field of action of rehabilitation professionals and groups, although there was felt to be a need for more attention in the associated code to the gradation of severity, which was often a predictor of handicap. There had also been increasing requests to revise the definition of ‘handicap’ in order to put more emphasis on the effect of interaction with the environment.

The rapid evolution of ideas and practices in the management of disablement had ruled out the production of a revised ICIDH in time to be submitted to the conference. It was stated that the publication of a new version was unlikely before implementation of the 10th revision.

6.5. Procedures in medicine

The International Classification of Procedures in Medicine (ICPM) (11) had been published by WHO in 1978 for trial purposes, in accordance with the recommendations of the 1975 Revision Conference and resolution WHA29.35 (10) of the 1976 World Health Assembly. The classification had been adopted by a few countries and was used as a basis for national classifications of surgical operations by a number of other countries.

The heads of WHO collaborating centres for classification of diseases had recognized that the process of drafting proposals, obtaining comments, redrafting and soliciting further comments, which WHO necessarily had to go through before finalization and publication, was inappropriate in such a rapidly advancing field as that of procedures. The centre heads had therefore recommended that there should be no revision of the ICPM in conjunction with the 10th revision of ICD.

In 1987 the expert committee had asked that WHO consider updating for the 10th revision at least the outline of Chapter 5, ‘Surgical procedures’, of the trial ICPM. In response to this request and the needs expressed by a number of countries, an attempt had been made by the Secretariat to prepare a tabulation list for procedures.
This list had been presented to the centre heads at their 1989 meeting and it had been agreed that it could serve as a guide for national presentation or publication of statistics on surgical procedures and could also facilitate intercountry comparisons. The aim of the list was to identify procedures and groups of procedures and define them as a basis for the development of national classifications, thereby improving the comparability of such classifications.

The conference agreed that such a list was of value and that work should continue on its development, even though any publication would follow the implementation of the 10th revision.

**6.6. International Nomenclature of Diseases**

Since 1970, the Council for International Organizations of Medical Sciences (CIOMS) had been involved in the preparation of an International Nomenclature of Diseases (IND), which would serve as a complement to the ICD.

The main purpose of the IND was to provide a single recommended name for every morbid entity. The main criteria for selection of that name were that it should be specific, unambiguous, as self-descriptive and simple as possible, and based on cause wherever feasible. Each disease or syndrome for which a name was recommended was defined as unambiguously and as briefly as possible. A list of synonyms was appended to each definition.

At the time of the conference, volumes had been published on diseases of the lower respiratory tract, infectious diseases (viral, bacterial and parasitic diseases and mycoses) and cardiac and vascular diseases, and work was under way on volumes for the digestive system, female genital system, urinary and male genital system, metabolic and endocrine diseases, blood and blood-forming organs, immunological system, musculoskeletal system and nervous system. Subjects proposed for future volumes included psychiatric diseases, as well as diseases of the skin, ear, nose and throat, and eye and adnexa.

The conference recognized that an authoritative, up-to-date and international nomenclature of diseases was important in developing the ICD and improving the comparability of health information. The conference therefore

RECOMMENDED that WHO and CIOMS be encouraged to explore cost-efficient ways to achieve the timely completion and maintenance of such a nomenclature.

**7. Implementation of the 10th revision of the ICD**

The conference was informed of WHO’s intention to publish the detailed four-character version of the 10th revision in three volumes: one containing the tabular list, a second containing all related definitions, standards, rules and instructions, and a third containing the alphabetical index.
The conference was further informed that a three-character version of the 10th revision would be published as a single volume which would contain, in the tabular list, all inclusion and exclusion notes. It would also contain all related definitions, standards, rules and instructions and a shortened alphabetical index.

Member States intending to produce national language versions of the 10th revision should notify WHO of their intentions. Copies of the drafts of the ICD at the three- and four-character levels would be made available from WHO both in printed form and on electronic media.

With respect to the physical appearance of the pages and type formats for both the tabular list and the alphabetical index, the conference was assured that recommendations from the centre heads and complaints from coders would be considered, and every attempt made to improve those aspects as compared with the ninth revision.

As with the ninth revision, it was intended to develop materials for the reorientation of trained coders, with the help of the collaborating centres. The actual training courses would be the responsibility of the WHO regional offices and individual countries. They would be carried out from late 1991 to the end of 1992, to finish before the implementation of the 10th revision.

Materials for the basic training of new users of the ICD would also be developed by WHO; it was not, however, planned to begin courses before 1993.

As noted above, WHO would be prepared to provide the 10th revision (both the tabular list and the alphabetical index) on electronic media. In future, with the assistance of the collaborating centres, other software might also be made available. A key for conversion from the ninth to the 10th revision, and the reverse, should be available before the implementation of the 10th revision.

As the development activities that had been endorsed by the expert committee were on schedule, the conference

**RECOMMENDED** that the 10th revision of the *International classification of diseases* should come into effect as from 1 January 1993.

### 8. Future revision of the ICD

The conference discussed the difficulties experienced during the extended period of use of the ninth revision, related to the emergence of new diseases and the lack of an updating mechanism to accommodate them.

Various suggestions for mechanisms to overcome these difficulties and avoid similar problems with respect to the 10th revision were discussed. There was a clear feeling that there was a need for ongoing information exchange to standardize the use of the 10th revision between countries, but that any changes introduced during its ‘lifetime’ should be considered very carefully in relation
to their impact on analyses and trends. There was discussion on the type of forum in which such changes and the potential for use of the vacant letter ‘U’ in new or temporary code assignments could be discussed. It was agreed that it would not be feasible to hold revision conferences more frequently than every 10 years.

On the basis of the needs expressed, and the fact that it would be inappropriate to attempt to determine or define the exact process to be used, the conference RECOMMENDED that the next International revision conference should take place in ten years’ time, and that WHO should endorse the concept of an updating process between revisions and give consideration as to how an effective updating mechanism could be put in place.

9. Adoption of the 10th Revision of the ICD

The conference made the following recommendation:

Having considered the proposals prepared by the organization on the basis of the recommendations of the expert committee on the *International classification of diseases – 10th revision*,

Recognizing the need for a few further minor modifications to reflect the comments on points of detail submitted by Member States during the conference,

RECOMMENDED that the proposed revised chapters, with their three-character categories and four-character subcategories and the Short tabulation lists for morbidity and mortality, constitute the 10th revision of the *International statistical classification of diseases and related health problems*.

Dengue is a viral disease transmitted by the bite of a mosquito infected by dengue viruses. It is one disease entity with different clinical presentations and often with unpredictable clinical evolution and outcome. Most patients recover following a self-limiting non-severe clinical course like nausea, vomiting, rash, aches and pains, but a small proportion progress to severe disease, mostly characterized by plasma leakage with or without haemorrhage, although severe haemorrhages or severe organ impairment can occur, with or without dengue shock.

Incl.: dengue haemorrhagic fever with warning signs
A97.2 Severe dengue
Clinical signs include: 1. severe plasma leakage leading to shock (dengue shock syndrome – DSS) and/or fluid accumulation with respiratory distress; 2. severe bleeding as evaluated by clinician; 3. severe organ involvement: liver aspartate transaminase (AST) or alanine aminotransferase (ALT) $\geq$ 1000, CNS: impaired consciousness (encephalitis), involvement of other organs, as myocarditis or nephritis

D00–D09 In situ neoplasms
D10–D36 Benign neoplasms
D37–D48 Neoplasms of uncertain or unknown behaviour

Notes

1. Primary, ill-defined, secondary and unspecified sites of malignant neoplasms

Categories C76–C80 include malignant neoplasms for which there is no clear indication of the original site of the cancer, or the cancer is stated to be ‘disseminated’, ‘scattered’ or ‘spread’ without mention of the primary site. In both cases the primary site is considered to be unknown.

2. Functional activity

All neoplasms are classified in this chapter, whether they are functionally active or not. An additional code from Chapter IV may be used, if desired, to identify functional activity associated with any neoplasm. For example, catecholamine-producing malignant phaeochromocytoma of adrenal gland should be coded to C74 with additional code E27.5; basophil adenoma of pituitary gland with Cushing syndrome should be coded to D35.2 with additional code E24.0.
3. Morphology

There are a number of major morphological (histological) groups of malignant neoplasms: carcinomas including squamous (cell) and adenocarcinomas; sarcomas; other soft tissue tumours including mesotheliomas; lymphomas (Hodgkin and non-Hodgkin); leukaemia; other specified and site-specific types; and unspecified cancers. Cancer is a generic term and may be used for any of the above groups, although it is rarely applied to the malignant neoplasms of lymphatic, haematopoietic and related tissue. ‘Carcinoma’ is sometimes used incorrectly as a synonym for ‘cancer’.

In Chapter II, neoplasms are classified predominantly by site within broad groupings for behaviour. In a few exceptional cases, morphology is indicated in the category and subcategory titles.

For those wishing to identify the histological type of neoplasm, the list of morphology codes of ICD-O is available for separate download online. The list formerly included in ICD-10 was outdated because it was derived from the second edition of the International classification of diseases for oncology (ICD-O). ICD-O is a dual-axis classification providing independent coding systems for topography and morphology. Morphology codes have six digits: the first four digits identify the histological type; the fifth digit is the behaviour code (malignant primary, malignant secondary (metastatic), in situ, benign, uncertain whether malignant or benign); and the sixth digit is a grading code (differentiation) for solid tumours, and is also used as a special code for lymphomas and leukaemias.

The ICD-O lists can be downloaded from the classification website of WHO (www.who.int/classifications).

4. Use of subcategories in Chapter II

Attention is drawn to the special use of subcategory .8 in this chapter [see note 5]. Where it has been necessary to provide subcategories for ‘other’, these have generally been designated as subcategory .7.

5. Malignant neoplasms overlapping site boundaries and the use of subcategory .8 (overlapping lesion)

Categories C00–C75 classify primary malignant neoplasms according to their point of origin. Many three-character categories are further divided into named parts or subcategories of the organ in question. A neoplasm that overlaps two or more contiguous sites within a three-character category, and whose point of origin cannot be determined, should be classified to the subcategory .8 (‘overlapping lesion’), unless the combination is specifically indexed elsewhere. For example, carcinoma of oesophagus and stomach is specifically indexed to C16.0 (cardia), while carcinoma of the tip and ventral surface of the tongue should be assigned to C02.8. On the other hand, carcinoma of the tip of the tongue extending to involve the ventral surface should be coded to C02.1, as the point of origin, the tip, is known. ‘Overlapping’ implies that the sites involved are contiguous (next to each other). Numerically consecutive subcategories are frequently anatomically contiguous, but this is not invariably so (e.g. bladder C67.-) and the coder may need to consult anatomical texts to determine the topographical relationships.
Sometimes a neoplasm overlaps the boundaries of three-character categories within certain systems. To take care of this, the following subcategories have been designated:

- C02.8 Overlapping lesion of tongue
- C08.8 Overlapping lesion of major salivary glands
- C14.8 Overlapping lesion of lip, oral cavity and pharynx
- C21.8 Overlapping lesion of rectum, anus and anal canal
- C24.8 Overlapping lesion of biliary tract
- C26.8 Overlapping lesion of digestive system
- C39.8 Overlapping lesion of respiratory and intrathoracic organs
- C41.8 Overlapping lesion of bone and articular cartilage
- C49.8 Overlapping lesion of connective and soft tissue
- C57.8 Overlapping lesion of female genital organs
- C63.8 Overlapping lesion of male genital organs
- C68.8 Overlapping lesion of urinary organs
- C72.8 Overlapping lesion of central nervous system

An example of this is a carcinoma of the stomach and small intestine, which should be coded to C26.8 (Overlapping lesion of digestive system).

6. Malignant neoplasms of ectopic tissue

Malignant neoplasms of ectopic tissue are to be coded to the site where they are found, e.g. ectopic pancreatic malignant neoplasms of ovary are coded to ovary (C56).

7. Use of the Alphabetical index in coding neoplasms

In addition to site, morphology and behaviour must also be taken into consideration when coding neoplasms, and reference should always be made first to the Alphabetical index entry for the morphological description.

The introductory pages of Volume 3 include general instructions about the correct use of the Alphabetical index. The specific instructions and examples pertaining to neoplasms should be consulted to ensure correct use of the categories and subcategories in Chapter II.

8. Use of the International classification of diseases for oncology (ICD-O)

For certain morphological types, Chapter II provides a rather restricted topographical classification, or none at all. The topography codes of ICD-O use for all neoplasms essentially the same three- and four-character categories that Chapter II uses for malignant neoplasms (C00–C77, C80), thus providing increased specificity of site for other neoplasms (malignant secondary (metastatic), benign, in situ and uncertain or unknown).

It is therefore recommended that agencies interested in identifying both the site and morphology of tumours, e.g. cancer registries, cancer hospitals, pathology departments and other agencies specializing in cancer, use ICD-O.
Malignant neoplasms
(C00–C97)

Use additional code (U85), if desired, to identify resistance, non-responsiveness and refractive properties of the neoplasm to antineoplastic drugs.

**In situ neoplasms**  
(D00–D09)

This system of grading has been extended to other organs, such as vulva and vagina. Descriptions of grade III intraepithelial neoplasia, with or without mention of severe dysplasia, are assigned to this section; grades I and II are classified as dysplasia of the organ system involved and should be coded to the relevant body system chapter.

Malnutrition
(E40–E46)

Note: The degree of malnutrition is usually measured in terms of weight, expressed in standard deviations from the mean of the relevant reference population. When one or more previous measurements are available, lack of weight gain in children, or evidence of weight loss in children or adults, is usually indicative of malnutrition. When only one measurement is available, the diagnosis is based on probabilities and is not definitive without other clinical or laboratory tests. In the exceptional circumstances that no measurement of weight is available, reliance should be placed on clinical evidence.

If an observed weight is below the mean value of the reference population, there is a high probability of severe malnutrition if there is an observed value situated 3 or more standard deviations below the mean value of the reference population; a high probability of moderate malnutrition for an observed value located between 2 and less than 3 standard deviations below this mean; and a high probability of mild malnutrition for an observed value located between 1 and less than 2 standard deviations below this mean.

Severe loss of weight [wasting] in children or adults, or lack of weight gain in children leading to an observed weight that is at least 3 standard deviations below the mean value for the reference population (or a similar loss expressed through other statistical approaches). When only one measurement is available, there is a high probability of severe wasting when the observed weight is 3 or more standard deviations below the mean of the reference population.
Incl.: starvation oedema

**E44.0**  
Moderate protein-energy malnutrition  
Weight loss in children or adults, or lack of weight gain in children leading to an observed weight that is 2 or more but less than 3 standard deviations below the mean value for the reference population (or a similar loss expressed through other statistical approaches). When only one measurement is available, there is a high probability of moderate protein-energy malnutrition when the observed weight is 2 or more but less than 3 standard deviations below the mean of the reference population.

**E44.1**  
Mild protein-energy malnutrition  
Weight loss in children or adults, or lack of weight gain in children leading to an observed weight that is 1 or more but less than 2 standard deviations below the mean value for the reference population (or a similar loss expressed through other statistical approaches). When only one measurement is available, there is a high probability of mild protein-energy malnutrition when the observed weight is 1 or more but less than 2 standard deviations below the mean of the reference population.

F80–F89 Disorders of psychological development
F90–F98 Behavioural and emotional disorders with onset usually occurring in childhood and adolescence
F99 Unspecified mental disorder

Asterisk categories for this chapter are provided as follows:
F00* Dementia in Alzheimer disease
F02* Dementia in other diseases classified elsewhere
Organic, including symptomatic, mental disorders (F00–F09)

This block comprises a range of mental disorders grouped together on the basis of their having in common a demonstrable etiology in cerebral disease, brain injury, or other insult leading to cerebral dysfunction. The dysfunction may be primary, as in diseases, injuries, and insults that affect the brain directly and selectively; or secondary, as in systemic diseases and disorders that attack the brain only as one of the multiple organs or systems of the body that are involved.

Dementia (F00–F03) is a syndrome due to disease of the brain, usually of a chronic or progressive nature, in which there is disturbance of multiple higher cortical functions, including memory, thinking, orientation, comprehension, calculation, learning capacity, language and judgement. Consciousness is not clouded. The impairments of cognitive function are commonly accompanied, and occasionally preceded, by deterioration in emotional control, social behaviour or motivation. This syndrome occurs in Alzheimer disease, in cerebrovascular disease, and in other conditions primarily or secondarily affecting the brain.

Use additional code, if desired, to identify the underlying disease.

**F00** Dementia in Alzheimer disease (G30.-†)
Alzheimer disease is a primary degenerative cerebral disease of unknown etiology with characteristic neuropathological and neurochemical features. The disorder is usually insidious in onset and develops slowly but steadily over a period of several years.

**F00.0** Dementia in Alzheimer disease with early onset (G30.0†)
Dementia in Alzheimer disease with onset before the age of 65 years, with a relatively rapid deteriorating course and with marked multiple disorders of the higher cortical functions.

Alzheimer disease, type 2
Presenile dementia, Alzheimer type
Primary degenerative dementia of the Alzheimer type, presenile onset

**F00.1** Dementia in Alzheimer disease with late onset (G30.1†)
Dementia in Alzheimer disease with onset after the age of 65 years, usually in the late 70s or thereafter, with a slow progression, and with memory impairment as the principal feature.

Alzheimer disease, type 1
Primary degenerative dementia of the Alzheimer type, senile onset
Senile dementia, Alzheimer type

**F00.2** Dementia in Alzheimer disease, atypical or mixed type (G30.8†)
Atypical dementia, Alzheimer type

**F00.9** Dementia in Alzheimer disease, unspecified (G30.9†)
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F01  Vascular dementia
Vascular dementia is the result of infarction of the brain due to vascular disease, including hypertensive cerebrovascular disease. The infarcts are usually small but cumulative in their effect. Onset is usually in later life.

Incl.: arteriosclerotic dementia

F01.0  Vascular dementia of acute onset
Usually develops rapidly after a succession of strokes from cerebrovascular thrombosis, embolism or haemorrhage. In rare cases, a single large infarction may be the cause.

F01.1  Multi-infarct dementia
Gradual in onset, following a number of transient ischaemic episodes that produce an accumulation of infarcts in the cerebral parenchyma.

Predominantly cortical dementia

F01.2  Subcortical vascular dementia
Includes cases with a history of hypertension and foci of ischaemic destruction in the deep white matter of the cerebral hemispheres. The cerebral cortex is usually preserved and this contrasts with the clinical picture, which may closely resemble that of dementia in Alzheimer disease.

F01.3  Mixed cortical and subcortical vascular dementia

F01.8  Other vascular dementia

F01.9  Vascular dementia, unspecified

F02*  Dementia in other diseases classified elsewhere
Cases of dementia due, or presumed to be due, to causes other than Alzheimer disease or cerebrovascular disease. Onset may be at any time in life, though rarely in old age.

F02.0*  Dementia in Pick disease (G31.0†)
A progressive dementia, commencing in middle age, characterized by early, slowly progressing changes of character and social deterioration, followed by impairment of intellect, memory and language functions, with apathy, euphoria and, occasionally, extrapyramidal phenomena.

F02.1*  Dementia in Creutzfeldt–Jakob disease (A81.0†)
A progressive dementia with extensive neurological signs, due to specific neuropathological changes that are presumed to be caused by a transmissible agent. Onset is usually in middle or later life, but may be at any adult age. The course is subacute, leading to death within one to two years.

F02.2*  Dementia in Huntington disease (G10†)
A dementia occurring as part of a widespread degeneration of the brain. The disorder is transmitted by a single autosomal dominant gene. Symptoms typically emerge in the third and fourth decade. Progression is slow, leading to death, usually within 10 to 15 years.

Dementia in Huntington chorea

A syndrome of prominent impairment of recent and remote memory while immediate recall is preserved, with reduced ability to learn new material and disorientation in time. F06.0 Organic hallucinosis

A disorder of persistent or recurrent hallucinations, usually visual or auditory, that
occur in clear consciousness and may or may not be recognized by the subject as
such. Delusional elaboration of the hallucinations may occur, but delusions do not
dominate the clinical picture; insight may be preserved.

Excl.: anxiety disorders, nonorganic or unspecified (F41.-)

Excl.: somatoform disorders, nonorganic or unspecified (F45.-)

F06.7 Mild cognitive disorder
A disorder characterized by impairment of memory, learning difficulties and reduced ability to concentrate on a task for more than brief periods. There is often a marked feeling of mental fatigue when mental tasks are attempted, and new learning is found to be subjectively difficult, even when objectively successful. None of these symptoms is so severe that a diagnosis of either dementia (F00–F03) or delirium (F05.-) can be made. This diagnosis should be made only in association with a specified physical disorder, and should not be made in the presence of any of the mental or behavioural disorders classified to F10–F99. The disorder may precede, accompany or follow a wide variety of infections and physical disorders, both cerebral and systemic, but direct evidence of cerebral involvement is not necessarily present. It can be differentiated from postencephalitic syndrome (F07.1) and postconcussional syndrome (F07.2) by its different etiology, more restricted range of generally milder symptoms and usually shorter duration.

Mental and behavioural disorders due to psychoactive substance use (F10–F19)

This block contains a wide variety of disorders that differ in severity and clinical form but that are all attributable to the use of one or more psychoactive substances, which may or may not have been medically prescribed. The third character of the code identifies the substance involved and the fourth character specifies the clinical state. The codes should be used, as required, for each substance specified, but it should be noted that not all fourth-character codes are applicable to all substances.

Identification of the psychoactive substance should be based on as many sources of information as possible. These include self-report data, analysis of blood and other body fluids, characteristic physical and psychological symptoms, clinical signs and behaviour, and other evidence such as a drug being in the patient’s possession or reports from informed third parties. Many drug users take more than one type of psychoactive substance. The main diagnosis should be classified, whenever possible, according to the substance or class of substances that has caused or contributed most to the presenting clinical syndrome. Other diagnoses should be coded when other psychoactive substances have been taken in intoxicating amounts (common fourth character .0) or to the extent of causing harm (common fourth character .1), dependence (common fourth character .2) or other disorders (common fourth character .3–.9).

Only in cases in which patterns of psychoactive substance-taking are chaotic and indiscriminate, or in which the contributions of different psychoactive substances are inextricably mixed, should the diagnosis of disorders resulting from multiple drug use (F19.-) be used.

Excl.: abuse of non-dependence-producing substances (F55)

The following fourth-character subdivisions are for use with categories F10–F19:

.0 Acute intoxication

A condition that follows the administration of a psychoactive substance resulting in disturbances in level of consciousness, cognition, perception, affect or behaviour, or other psycho-physiological functions and responses. The disturbances are directly related to the acute pharmacological effects of the substance and resolve with time, with complete recovery, except where tissue damage or other complications have arisen. Complications may include trauma, inhalation of vomitus, delirium, coma, convulsions, and other medical complications. The nature of these complications depends on the pharmacological class of substance and mode of administration.

Acute drunkenness (in alcoholism)
‘Bad trips’ (drugs)
Drunkenness NOS
Pathological intoxication
Trance and possession disorders in psychoactive substance intoxication

Excl.: intoxication meaning poisoning (T36–T50)
.1 Harmful use
A pattern of psychoactive substance use that is causing damage to health. The
damage may be physical (as in cases of hepatitis from the self-administration of
injected psychoactive substances) or mental (e.g. episodes of depressive disorder
secondary to heavy consumption of alcohol).
Psychoactive substance abuse

.2 Dependence syndrome
A cluster of behavioural, cognitive and physiological phenomena that develop after
repeated substance use and that typically include a strong desire to take the drug,
difficulties in controlling its use, persisting in its use despite harmful consequences,
a higher priority given to drug use than to other activities and obligations, increased
tolerance, and sometimes a physical withdrawal state.
The dependence syndrome may be present for a specific psychoactive substance
(e.g. tobacco, alcohol or diazepam), for a class of substances (e.g. opioid drugs) or
for a wider range of pharmacologically different psychoactive substances.
Chronic alcoholism
Dipsomania
Drug addiction

.3 Withdrawal state
A group of symptoms of variable clustering and severity, occurring on absolute or
relative withdrawal of a psychoactive substance after persistent use of that substance.
The onset and course of the withdrawal state are time-limited and are related to the
type of psychoactive substance and dose being used immediately before cessation or
reduction of use. The withdrawal state may be complicated by convulsions.

.4 Withdrawal state with delirium
A condition where the withdrawal state as defined in the common fourth character
.3 is complicated by delirium as defined in F05.-. Convulsions may also occur.
When organic factors are also considered to play a role in the etiology, the condition
should be classified to F05.8.
Delirium tremens (alcohol-induced)

.5 Psychotic disorder
A cluster of psychotic phenomena that occur during or following psychoactive
substance use but that are not explained on the basis of acute intoxication alone
and do not form part of a withdrawal state. The disorder is characterized by
hallucinations (typically auditory, but often in more than one sensory modality),
perceptual distortions, delusions (often of a paranoid or persecutory nature),
psychomotor disturbances (excitement or stupor) and an abnormal affect, which
may range from intense fear to ecstasy. The sensorium is usually clear but some
degree of clouding of consciousness, though not severe confusion, may be present.
Alcoholic:
• hallucinosis
• jealousy
• paranoia
• psychosis NOS

*Excl.*: alcohol- or other psychoactive-substance-induced residual and late-
onset psychotic disorder (F10–F19 with common fourth character .7)
.6 Amnesic syndrome
A syndrome associated with chronic prominent impairment of recent and remote memory. Immediate recall is usually preserved and recent memory is characteristically more disturbed than remote memory. Disturbances of time sense and ordering of events are usually evident, as are difficulties in learning new material. Confabulation may be marked but is not invariably present. Other cognitive functions are usually relatively well preserved and amnesic defects are out of proportion to other disturbances.

Amnestic disorder, alcohol- or drug-induced
Korsakov psychosis or syndrome, alcohol- or other psychoactive substance-induced or unspecified
Use additional code, (E51.2†, G32.8*), if desired, when associated with Wernicke disease or syndrome.

Excl.: nonalcoholic Korsakov psychosis or syndrome (F04)

.7 Residual and late-onset psychotic disorder
A disorder in which alcohol- or psychoactive-substance-induced changes of cognition, affect, personality, or behaviour persist beyond the period during which a direct psychoactive-substance-related effect might reasonably be assumed to be operating. Onset of the disorder should be directly related to the use of the psychoactive substance. Cases in which initial onset of the state occurs later than episode(s) of such substance use should be coded here only where clear and strong evidence is available to attribute the state to the residual effect of the psychoactive substance. Flashbacks may be distinguished from psychotic state partly by their episodic nature, frequently of very short duration, and by their duplication of previous alcohol- or other psychoactive-substance-related experiences.

Alcoholic dementia NOS
Chronic alcoholic brain syndrome
Dementia and other milder forms of persisting impairment of cognitive functions
Flashbacks
Late-onset psychoactive substance-induced psychotic disorder
Posthallucinogen perception disorder
Residual:
• affective disorder
• disorder of personality and behaviour

Excl.: alcohol- or psychoactive-substance-induced:
• Korsakov syndrome (F10–F19 with common fourth character .6)
• psychotic state (F10–F19 with common fourth character .5)

This category should be used when two or more psychoactive substances are known to be involved, but it is impossible to assess which substance is contributing most to the disorders. It should also be used when the exact identity of some or even all the psychoactive substances being used is uncertain or unknown, since many multiple drug users themselves often do not know the details of what they are taking.

Incl.: misuse of drugs NOS
Schizophrenia, schizotypal and delusional disorders (F20–F29)

This block brings together schizophrenia, as the most important member of the group, schizotypal disorder, persistent delusional disorders, and a larger group of acute and transient psychotic disorders. Schizoaffective disorders have been retained here in spite of their controversial nature.

F20 Schizophrenia

The schizophrenic disorders are characterized in general by fundamental and characteristic distortions of thinking and perception, and affects that are inappropriate or blunted. Clear consciousness and intellectual capacity are usually maintained, although certain cognitive deficits may evolve in the course of time. The most important psychopathological phenomena include thought echo; thought insertion or withdrawal; thought broadcasting; delusional perception and delusions of control; influence or passivity; hallucinatory voices commenting or discussing the patient in the third person; thought disorders; and negative symptoms.

The course of schizophrenic disorders can be either continuous, or episodic with progressive or stable deficit, or there can be one or more episodes with complete or incomplete remission. The diagnosis of schizophrenia should not be made in the presence of extensive depressive or manic symptoms unless it is clear that schizophrenic symptoms antedate the affective disturbance. Nor should schizophrenia be diagnosed in the presence of overt brain disease or during states of drug intoxication or withdrawal. Similar disorders developing in the presence of epilepsy or other brain disease should be classified under F06.2, and those induced by psychoactive substances under F10–F19 with common fourth character 5.

**Excl.:** schizophrenia:
- acute (undifferentiated) (F23.2)
- cyclic (F25.2)
- schizophrenic reaction (F23.2)
- schizotypal disorder (F21)

F20.0 Paranoid schizophrenia

Paranoid schizophrenia is dominated by relatively stable, often paranoid delusions, usually accompanied by hallucinations, particularly of the auditory variety, and perceptual disturbances. Disturbances of affect, volition and speech, and catatonic symptoms, are either absent or relatively inconspicuous.

Paraphrenic schizophrenia

**Excl.:** involutional paranoid state (F22.8)
- paranoia (F22.0)

F20.1 Hebephrenic schizophrenia

A form of schizophrenia in which affective changes are prominent, delusions and hallucinations fleeting and fragmentary, behaviour irresponsible and unpredictable, and mannerisms common. The mood is shallow and inappropriate, thought is disorganized, and speech is incoherent. There is a tendency to social isolation. Usually the prognosis is poor because of the rapid development of ‘negative’ symptoms, particularly flattening of affect and loss of volition. Hebephrenia should normally be diagnosed only in adolescents or young adults.

Disorganized schizophrenia

Hebephrenia
F20.2 Catatonic schizophrenia
Catatonic schizophrenia is dominated by prominent psychomotor disturbances that may alternate between extremes such as hyperkinesis and stupor, or automatic obedience and negativism. Constrained attitudes and postures may be maintained for long periods. Episodes of violent excitement may be a striking feature of the condition. The catatonic phenomena may be combined with a dream-like (oneiroid) state with vivid scenic hallucinations.

Catatonic stupor
Schizophrenic:
• catalepsy
• catatonia
• flexibilitas cerea

F20.3 Undifferentiated schizophrenia
Psychotic conditions meeting the general diagnostic criteria for schizophrenia but not conforming to any of the subtypes in F20.0–F20.2, or exhibiting the features of more than one of them without a clear predominance of a particular set of diagnostic characteristics.

Atypical schizophrenia

Excl.: acute schizophrenia-like psychotic disorder (F23.2)
chronic undifferentiated schizophrenia (F20.5)
post-schizophrenic depression (F20.4)

F20.4 Post-schizophrenic depression
A depressive episode, which may be prolonged, arising in the aftermath of a schizophrenic illness. Some schizophrenic symptoms, either ‘positive’ or ‘negative’, must still be present but they no longer dominate the clinical picture. These depressive states are associated with an increased risk of suicide. If the patient no longer has any schizophrenic symptoms, a depressive episode should be diagnosed (F32.-). If schizophrenic symptoms are still florid and prominent, the diagnosis should remain that of the appropriate schizophrenic subtype (F20.0–F20.3).

F20.5 Residual schizophrenia
A chronic stage in the development of a schizophrenic illness in which there has been a clear progression from an early stage to a later stage characterized by long-term, though not necessarily irreversible, ‘negative’ symptoms, e.g. psychomotor slowing; underactivity; blunting of affect; passivity and lack of initiative; poverty of quantity or content of speech; poor nonverbal communication by facial expression, eye contact, voice modulation and posture; poor self-care and social performance.

Chronic undifferentiated schizophreniainia
Restzustand (schizophrenic)
Schizophrenic residual state

F20.6 Simple schizophrenia
A disorder in which there is an insidious but progressive development of oddities of conduct, inability to meet the demands of society, and decline in total performance. The characteristic negative features of residual schizophrenia (e.g. blunting of affect and loss of volition) develop without being preceded by any overt psychotic symptoms.

F21 Schizotypal disorder
A disorder characterized by eccentric behaviour and anomalies of thinking and affect that resemble those seen in schizophrenia, though no definite and characteristic schizophrenic anomalies occur at any stage. The symptoms may include a cold or inappropriate affect; anhedonia; odd or eccentric behaviour; a tendency to social withdrawal; paranoid or bizarre ideas not amounting to true delusions; obsessive ruminations; thought disorder and perceptual disturbances; occasional transient quasi-psychotic episodes with intense illusions, auditory or other hallucinations and delusion-like ideas, usually occurring without external provocation. There is no definite onset and evolution and course are usually those of a personality disorder.

Incl.: latent schizophrenic reaction

• borderline
• latent
• prepsychotic
• prodromal
• pseudoneurotic
• pseudopsychopathic
schizotypal personality disorder

Excl.: Asperger syndrome (F84.5)
schizoid personality disorder (F60.1)

F22 Persistent delusional disorders
Includes a variety of disorders in which long-standing delusions constitute the only, or the most conspicuous, clinical characteristic and that cannot be classified as organic, schizophrenic or affective. Delusional disorders that have lasted for less than a few months should be classified, at least temporarily, under F23.-.
F22.0 Delusional disorder

A disorder characterized by the development either of a single delusion or of a set of related delusions that are usually persistent and sometimes lifelong. The content of the delusion or delusions is very variable. Clear and persistent auditory hallucinations (voices), schizophrenic symptoms such as delusions of control and marked blunting of affect, and definite evidence of brain disease are all incompatible with this diagnosis. However, the presence of occasional or transitory auditory hallucinations, particularly in elderly patients, does not rule out this diagnosis, provided that they are not typically schizophrenic and form only a small part of the overall clinical picture.

Excl.: paranoid:

F22.8 Other persistent delusional disorders

Disorders in which the delusion or delusions are accompanied by persistent hallucinatory voices or by schizophrenic symptoms that do not justify a diagnosis of schizophrenia (F20.-).

Delusional dysmorphophobia
Involutional paranoid state
Paranoia querulans

F22.9 Persistent delusional disorder, unspecified

F23 Acute and transient psychotic disorders

A heterogeneous group of disorders characterized by the acute onset of psychotic symptoms such as delusions, hallucinations and perceptual disturbances, and by the severe disruption of ordinary behaviour. Acute onset is defined as a crescendo development of a clearly abnormal clinical picture in about two weeks or less. For these disorders, there is no evidence of organic causation. Perplexity and puzzlement are often present but disorientation for time, place and person is not persistent or severe enough to justify a diagnosis of organically caused delirium (F05.-). Complete recovery usually occurs within a few months, often within a few weeks or even days. If the disorder persists, a change in classification will be necessary. The disorder may or may not be associated with acute stress, defined as usually stressful events preceding the onset by one to two weeks.
F23.0 Acute polymorphic psychotic disorder without symptoms of schizophrenia

An acute psychotic disorder in which hallucinations, delusions or perceptual disturbances are obvious but markedly variable, changing from day to day or even from hour to hour. Emotional turmoil with intense transient feelings of happiness or ecstasy, or anxiety and irritability, is also frequently present. The polymorphism and instability are characteristic for the overall clinical picture and the psychotic features do not justify a diagnosis of schizophrenia (F20.-). These disorders often have an abrupt onset, developing rapidly within a few days, and they frequently show a rapid resolution of symptoms with no recurrence. If the symptoms persist, the diagnosis should be changed to persistent delusional disorder (F22.-).

Bouffée délirante without symptoms of schizophrenia or unspecified Cycloid psychosis without symptoms of schizophrenia or unspecified

F23.1 Acute polymorphic psychotic disorder with symptoms of schizophrenia

An acute psychotic disorder in which the polymorphic and unstable clinical picture is present, as described in F23.0; despite this instability, however, some symptoms typical of schizophrenia are also in evidence for the majority of the time. If the schizophrenic symptoms persist, the diagnosis should be changed to schizophrenia (F20.-).

Bouffée délirante with symptoms of schizophrenia
Cycloid psychosis with symptoms of schizophrenia

F23.2 Acute schizophrenia-like psychotic disorder

An acute psychotic disorder in which the psychotic symptoms are comparatively stable and justify a diagnosis of schizophrenia, but have lasted for less than about one month; the polymorphic unstable features, as described in F23.0, are absent. If the schizophrenic symptoms persist, the diagnosis should be changed to schizophrenia (F20.-).

F23.3 Other acute predominantly delusional psychotic disorders

Paranoid reaction
Psychogenic paranoid psychosis
INTERNATIONAL CLASSIFICATION OF DISEASES

Reactive psychosis

F24 Induced delusional disorder
A delusional disorder shared by two or more people with close emotional links. Only one of the people suffers from a genuine psychotic disorder; the delusions are induced in the other(s) and usually disappear when the people are separated.
Incl.: folie à deux
induced:
  • paranoid disorder
  • psychotic disorder

F25 Schizoaffective disorders
Episodic disorders in which both affective and schizophrenic symptoms are prominent but that do not justify a diagnosis of either schizophrenia or depressive or manic episodes. Other conditions in which affective symptoms are superimposed on a pre-existing schizophrenic illness, or coexist or alternate with persistent delusional disorders of other kinds, are classified under F20–F29. Mood-incongruent psychotic symptoms in affective disorders do not justify a diagnosis of schizoaffective disorder.

F25.0 Schizoaffective disorder, manic type
A disorder in which both schizophrenic and manic symptoms are prominent, so that the episode of illness does not justify a diagnosis of either schizophrenia or a manic episode. This category should be used for both a single episode and a recurrent disorder in which the majority of episodes are schizoaffective, manic type.
Schizoaffective psychosis, manic type
Schizophreniform psychosis, manic type

F25.1 Schizoaffective disorder, depressive type
A disorder in which both schizophrenic and depressive symptoms are prominent, so that the episode of illness does not justify a diagnosis of either schizophrenia or a depressive episode. This category should be used for both a single episode and a recurrent disorder in which the majority of episodes are schizoaffective, depressive type.

Mood [affective] disorders
(F30–F39)

This block contains disorders in which the fundamental disturbance is a change in affect or mood, to depression (with or without associated anxiety) or to elation. The mood change is usually accompanied by a change in the overall level of activity; most of the other symptoms are either secondary to, or easily understood in the context of, the change in mood and activity. Most of these disorders tend to be recurrent and the onset of individual episodes can often be related to stressful events or situations.

F30 Manic episode
All the subdivisions of this category should be used only for a single episode. Hypomanic or manic episodes in individuals who have had one or more previous affective episodes (depressive, hypomanic, manic or mixed) should be coded as bipolar affective disorder (F31.-).
   Incl.: bipolar disorder, single manic episode

F30.0 Hypomania
A disorder characterized by a persistent mild elevation of mood, increased energy and activity, and usually marked feelings of well-being and both physical and mental efficiency. Increased sociability, talkativeness, over-familiarity, increased sexual energy and a decreased need for sleep are often present but not to the extent that they lead to severe disruption of work or result in social rejection. Irritability, conceit and boorish behaviour may take the place of the more usual euphoric sociability. The disturbances of mood and behaviour are not accompanied by hallucinations or delusions.
F30.1 Mania without psychotic symptoms
Mood is elevated out of keeping with the patient’s circumstances and may vary from carefree joviality to almost uncontrollable excitement. Elation cannot be sustained, and there is often marked distractibility. Self-esteem is often inflated, with grandiose ideas and overconfidence. Loss of normal social inhibitions may result in behaviour that is reckless, foolhardy or inappropriate to the circumstances, and out of character.

F30.2 Mania with psychotic symptoms
In addition to the clinical picture described in F30.1, delusions (usually grandiose) or hallucinations (usually of voices speaking directly to the patient) are present, or the excitement, excessive motor activity and flight of ideas are so extreme that the subject is incomprehensible or inaccessible to ordinary communication.

F31 Bipolar affective disorder
A disorder characterized by two or more episodes in which the patient’s mood and activity levels are significantly disturbed this disturbance consisting on some occasions of an elevation of mood and increased energy and activity (hypomania or mania) and on others of a lowering of mood and decreased energy and activity (depression). Repeated episodes of hypomania or mania only are classified as bipolar.

Incl.: manic depression
manic-depressive:
• illness
• psychosis

Excl.: bipolar disorder, single manic episode (F30.-)

F31.1 Bipolar affective disorder, current episode manic without psychotic symptoms
The patient is currently manic, without psychotic symptoms (as in F30.1) and has had at least one other affective episode (hypomanic, manic, depressive or mixed) in the past.
F31.2 Bipolar affective disorder, current episode manic with psychotic symptoms
The patient is currently manic, with psychotic symptoms (as in F30.2), and has had at least one other affective episode (hypomanic, manic, depressive or mixed) in the past.

F31.3 Bipolar affective disorder, current episode mild or moderate depression

**Depressive episode**

In typical mild, moderate or severe depressive episodes, the patient suffers from lowering of mood, reduction of energy and decrease in activity. Capacity for enjoyment, interest and concentration is reduced, and marked tiredness after even minimum effort is common. Sleep is usually disturbed and appetite diminished. Self-esteem and self-confidence are almost always reduced and, even in the mild form, some ideas of guilt or worthlessness are often present. The lowered mood varies little from day to day, is unresponsive to circumstances and may be accompanied by so-called ‘somatic’ symptoms, such as loss of interest and pleasurable feelings, waking in the morning several hours before the usual time, depression worst in the morning, marked psychomotor retardation, agitation, loss of appetite, weight loss, and loss of libido. Depending upon the number and severity of the symptoms, a depressive episode may be specified as mild, moderate or severe.

Two or three of the above symptoms are usually present. The patient is usually distressed by these but will probably be able to continue with most activities.

**F32.1**

**Moderate depressive episode**

Four or more of the above symptoms are usually present and the patient is likely to have great difficulty in continuing with ordinary activities.

**F32.2**

**Severe depressive episode without psychotic symptoms**

An episode of depression in which several of the above symptoms are marked and distressing, typically loss of self-esteem and ideas of worthlessness or guilt. Suicidal thoughts and acts are common and a number of ‘somatic’ symptoms are usually present.

**Severe depressive episode with psychotic symptoms**

An episode of depression as described in F32.2, but with the presence of hallucinations, delusions, psychomotor retardation or stupor so severe that ordinary social activities are impossible; there may be danger to life from suicide, dehydration or starvation. The hallucinations and delusions may or may not be mood-congruent.

F33 Recurrent depressive disorder
A disorder characterized by repeated episodes of depression as described for depressive episode (F32.-), without any history of independent episodes of mood elevation and increased energy (mania). There may, however, be brief episodes of mild mood elevation and overactivity (hypomania) immediately after a depressive episode, sometimes precipitated by antidepressant treatment. The more severe forms of recurrent depressive disorder (F33.2 and F33.3) have much in common with earlier concepts such as manic-depressive depression, melancholia, vital depression and endogenous depression. The first episode may occur at any age from childhood to old age, the onset may be either acute or insidious, and the duration varies from a few weeks to many months. The risk that a patient with recurrent depressive disorder will have an episode of mania never disappears completely, however many depressive episodes have been experienced. If such an episode does occur, the diagnosis should be changed to bipolar affective disorder (F31.-).

F34 Persistent mood [affective] disorders
Persistent and usually fluctuating disorders of mood in which the majority of the individual episodes are not sufficiently severe to warrant being described as hypomanic or mild depressive episodes. Because they last for many years, and sometimes for the greater part of the patient’s adult life, they involve considerable distress and disability. In some instances, recurrent or single manic or depressive episodes may become superimposed on a persistent affective disorder.

F34.0 Cyclothymia
A persistent instability of mood involving numerous periods of depression and mild elation, none of which is sufficiently severe or prolonged to justify a diagnosis of bipolar affective disorder (F31.-) or recurrent depressive disorder (F33.-). This disorder is frequently found in the relatives of patients with bipolar affective disorder. Some patients with cyclothymia eventually develop bipolar affective disorder.

F40 Phobic anxiety disorders
A group of disorders in which anxiety is evoked only, or predominantly, in certain well-defined situations that are not currently dangerous. As a result, these situations are characteristically avoided or endured with dread. The patient’s concern may be focused on individual symptoms like palpitations or feeling faint and is often associated with secondary fears of dying, losing control, or going mad. Contemplating entry to the phobic situation usually generates anticipatory anxiety. Phobic anxiety and depression often coexist. Whether two diagnoses, phobic anxiety and depressive episode, are needed, or only one, is determined by the time course of the two conditions and by therapeutic considerations at the time of consultation.

F40.0 Agoraphobia
A fairly well-defined cluster of phobias embracing fears of leaving home, entering shops, crowds and public places, or travelling alone in trains, buses or planes. Panic disorder is a frequent feature of both present and past episodes. Depressive and obsessional symptoms and social phobias are also commonly present as subsidiary features. Avoidance of the phobic situation is often prominent, and some agoraphobics experience little anxiety because they are able to avoid their phobic situations.

Agoraphobia without history of panic disorder
Panic disorder with agoraphobia
F40.1 Social phobias
Fear of scrutiny by other people, leading to avoidance of social situations. More pervasive social phobias are usually associated with low self-esteem and fear of criticism. They may present as a complaint of blushing, hand tremor, nausea or urgency of micturition, the patient sometimes being convinced that one of these secondary manifestations of their anxiety is the primary problem. Symptoms may progress to panic attacks.

Anthropophobia
Social neurosis

F40.2 Specific (isolated) phobias
Phobias restricted to highly specific situations such as proximity to particular animals, heights, thunder, darkness, flying, closed spaces, urinating or defecating in public toilets, eating certain foods, dentistry or the sight of blood or injury. Though the triggering situation is discrete, contact with it can evoke panic as in agoraphobia or social phobia.

F41 Other anxiety disorders
Disorders in which manifestation of anxiety is the major symptom and is not restricted to any particular environmental situation. Depressive and obsessional symptoms, and even some elements of phobic anxiety, may also be present, provided that they are clearly secondary or less severe.

F41.0 Panic disorder [episodic paroxysmal anxiety]
The essential feature is recurrent attacks of severe anxiety (panic), which are not restricted to any particular situation or set of circumstances and are therefore unpredictable. As with other anxiety disorders, the dominant symptoms include sudden onset of palpitations, chest pain, choking sensations, dizziness and feelings of unreality (depersonalization or derealization). There is often also a secondary fear of dying, losing control or going mad. Panic disorder should not be given as the main diagnosis if the patient has a depressive disorder at the time the attacks start; in these circumstances, the panic attacks are probably secondary to depression.

CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F41.1 Generalized anxiety disorder
Anxiety that is generalized and persistent but not restricted to, or even strongly predominating in, any particular environmental circumstances (i.e. it is ‘free-floating’). The dominant symptoms are variable but include complaints of persistent nervousness, trembling, muscular tensions, sweating, lightheadedness, palpitations, dizziness and epigastric discomfort. Fears that the patient or a relative will shortly become ill or have an accident are often expressed.

Anxiety:
• neurosis
• reaction
• state

F41.2 Mixed anxiety and depressive disorder
This category should be used when symptoms of anxiety and depression are both present, but neither is clearly predominant, and neither type of symptom is present to the extent that justifies a diagnosis if considered separately. When both anxiety and depressive symptoms are present and severe enough to justify individual diagnoses, both diagnoses should be recorded and this category should not be used.

Anxiety depression (mild or not persistent)

F41.3 Other mixed anxiety disorders

F41.9 Anxiety disorder, unspecified
Anxiety NOS

F42 Obsessive-compulsive disorder
The essential feature is recurrent obsessional thoughts or compulsive acts. Obsessional thoughts are ideas, images or impulses that enter the patient’s mind again and again in a stereotyped form. They are almost invariably distressing and the patient often tries, unsuccessfully, to resist them. They are, however, recognized as his or her own thoughts, even though they are involuntary and often repugnant. Compulsive acts or rituals are stereotyped behaviours that are repeated again and again. They are not inherently enjoyable, nor do they result in the completion of inherently useful tasks. Their function is to prevent some objectively unlikely event, often involving harm to, or caused by, the patient, which he or she fears might otherwise occur. Usually, this behaviour is recognized by the patient as pointless or ineffectual and repeated attempts are made to resist. Anxiety is almost invariably present. If compulsive acts are resisted, the anxiety gets worse.

Incl.: anankastic neurosis
obsessive-compulsive neurosis

Excl.: obsessive-compulsive personality (disorder) (F60.5)
F42.0  Predominantly obsessional thoughts or ruminations
These may take the form of ideas, mental images or impulses to act, which are nearly always distressing to the subject. Sometimes the ideas are an indecisive, endless consideration of alternatives, associated with an inability to make trivial but necessary decisions in day-to-day living. The relationship between obsessional ruminations and depression is particularly close and a diagnosis of obsessive-compulsive disorder should be preferred only if ruminations arise or persist in the absence of a depressive episode.

F42.1  Predominantly compulsive acts [obsessional rituals]
The majority of compulsive acts are concerned with cleaning (particularly handwashing), repeated checking to ensure that a potentially dangerous situation has not been allowed to develop, or orderliness and tidiness. Underlying the overt behaviour is a fear, usually of danger either to or caused by the patient, and the ritual is an ineffectual or symbolic attempt to avert that danger.

F42.2  Mixed obsessional thoughts and acts
F42.8  Other obsessive-compulsive disorders
F42.9  Obsessive-compulsive disorder, unspecified

F43  Reaction to severe stress, and adjustment disorders
This category differs from others, in that it includes disorders identifiable on the basis of not only symptoms and course but also the existence of one or other of two causative influences: an exceptionally stressful life event producing an acute stress reaction, or a significant life change leading to continued unpleasant circumstances that result in an adjustment disorder. Although less severe psychosocial stress (‘life events’) may precipitate the onset or contribute to the presentation of a very wide range of disorders classified elsewhere in this chapter, its etiological importance is not always clear and in each case will be found to depend on individual, often idiosyncratic, vulnerability, i.e. the life events are neither necessary nor sufficient to explain the occurrence and form of the disorder. In contrast, the disorders brought together here are thought to arise always as a direct consequence of acute severe stress or continued trauma. The stressful events or the continuing unpleasant circumstances are the primary and overriding causal factor and the disorder would not have occurred without their impact. The disorders in this section can thus be regarded as maladaptive responses to severe or continued stress, in that they interfere with successful coping mechanisms and therefore lead to problems of social functioning.

F43.0  Acute stress reaction
A transient disorder that develops in an individual without any other apparent mental disorder, in response to exceptional physical and mental stress and that usually subsides within hours or days. Individual vulnerability and coping capacity play a role in the occurrence and severity of acute stress reactions. The symptoms show a typically mixed and changing picture and include an initial state of ‘daze’, with some constriction of the field of consciousness and narrowing of attention, inability to comprehend stimuli, and disorientation. This state may be followed either by further withdrawal from the surrounding situation (to the extent of a dissociative stupor – F44.2), or by agitation and overactivity (flight reaction or fugue). Autonomic signs of panic anxiety (tachycardia, sweating, flushing) are commonly present. The symptoms usually appear within minutes of the impact of
the stressful stimulus or event, and disappear within two to three days (often within hours). Partial or complete amnesia (F44.0) for the episode may be present. If the symptoms persist, a change in diagnosis should be considered.

Acute:
• crisis reaction
• reaction to stress
Combat fatigue
Crisis state
Psychic shock

**F43.1 Post-traumatic stress disorder**

Arises as a delayed or protracted response to a stressful event or situation (of either brief or long duration) of an exceptionally threatening or catastrophic nature, which is likely to cause pervasive distress in almost anyone. Predisposing factors, such as personality traits (e.g. compulsive, asthenic) or previous history of neurotic illness, may lower the threshold for the development of the syndrome or aggravate its course, but they are neither necessary nor sufficient to explain its occurrence. Typical features include episodes of repeated reliving of the trauma in intrusive memories (‘flashbacks’), dreams or nightmares, occurring against the persisting background of a sense of ‘numbness’ and emotional blunting, detachment from other people, unresponsiveness to surroundings, anhedonia, and avoidance of activities and situations reminiscent of the trauma. There is usually a state of autonomic hyperarousal with hypervigilance, an enhanced startle reaction, and insomnia. Anxiety and depression are commonly associated with the above symptoms and signs, and suicidal ideation is not infrequent. The onset follows the trauma with a latency period that may range from a few weeks to months. The course is fluctuating but recovery can be expected in the majority of cases. In a small proportion of cases, the condition may follow a chronic course over many years, with eventual transition to an enduring personality change (F62.0).

Traumatic neurosis

**F43.2 Adjustment disorders**

States of subjective distress and emotional disturbance, usually interfering with social functioning and performance, arising in the period of adaptation to a significant life change or a stressful life event. The stressor may have affected the integrity of an individual’s social network (bereavement, separation experiences) or the wider system of social supports and values (migration, refugee status), or represented a major developmental transition or crisis (going to school, becoming a parent, failure to attain a cherished personal goal, retirement). Individual predisposition or vulnerability plays an important role in the risk of occurrence and the shaping of the manifestations of adjustment disorders, but it is nevertheless assumed that the condition would not have arisen without the stressor. The manifestations vary and include depressed mood, anxiety or worry (or mixture of these) and a feeling of inability to cope, plan ahead or continue in the present situation, as well as some degree of disability in the performance of daily routine. Conduct disorders may be an associated feature, particularly in adolescents. The predominant feature may be a brief or prolonged depressive reaction, or a disturbance of other emotions and conduct.

Dissociative [conversion] disorders

The common themes that are shared by dissociative or conversion disorders are a partial or complete loss of the normal integration between memories of the past, awareness of identity and immediate sensations, and control of bodily movements. All types of dissociative disorders tend to remit after a few weeks or months, particularly if their onset is associated with a traumatic life event. More chronic disorders, particularly paralyses and anaesthesias, may develop if the onset is associated with insoluble problems or interpersonal difficulties. These disorders have previously been classified as various types of ‘conversion hysteria’. They are presumed to be psychogenic in origin, being associated closely in time with traumatic events, insoluble and intolerable problems, or disturbed relationships. The symptoms often represent the patient’s concept of how a physical illness would be manifest. Medical examination and investigation do not reveal the presence of any known physical or neurological disorder. In addition, there is evidence that the loss of function is an expression of emotional conflicts or needs. The symptoms may develop in close relationship to psychological stress, and often appear suddenly. Only disorders of physical functions normally under voluntary control, and loss of sensations, are included here. Disorders involving pain and other complex physical sensations, mediated by the autonomic nervous system are classified under somatization disorder (F45.0). The possibility of the later appearance of serious physical or psychiatric disorders should always be kept in mind.

Incl.: conversion:

Excl.: malingering [conscious simulation] (Z76.5)

Dissociative amnesia

The main feature is loss of memory, usually of important recent events, that is not due to organic mental disorder, and is too great to be explained by ordinary forgetfulness or fatigue. The amnesia is usually centred on traumatic events, such as accidents or unexpected bereavements, and is usually partial and selective. Complete and generalized amnesia is rare, and is usually part of a fugue (F44.1). If this is the case, the disorder should be classified as such. The diagnosis should not be made in the presence of organic brain disorders, intoxication or excessive fatigue.

Excl.: alcohol- or other psychoactive-substance-induced amnestic disorder (F10–F19 with common fourth character .6)
- amnesia:
  - NOS (R41.3)

- nonalcoholic organic amnestic syndrome (F04)

F44.1 **Dissociative fugue**
Dissociative fugue has all the features of dissociative amnesia, plus purposeful travel beyond the usual everyday range. Although there is amnesia for the period of the fugue, the patient's behaviour during this time may appear completely normal to independent observers.

**Excl.:** postictal fugue in epilepsy (G40.-)

F44.2 **Dissociative stupor**
Dissociative stupor is diagnosed on the basis of a profound diminution or absence of voluntary movement and normal responsiveness to external stimuli such as light, noise and touch, but examination and investigation reveal no evidence of a physical cause. In addition, there is positive evidence of psychogenic causation in the form of recent stressful events or problems.

- schizophrenia (F20.-)

F44.4 **Dissociative motor disorders**
In the commonest varieties, there is loss of ability to move the whole or a part of a limb or limbs. There may be close resemblance to almost any variety of ataxia, apraxia, akinesia, aphony, dysarthria, dyskinesia, seizures or paralysis.

Psychogenic:
- aphony
- dysphonia

F44.5 **Dissociative convulsions**
Dissociative convulsions may mimic epileptic seizures very closely in terms of movements, but tongue-biting, bruising due to falling, and incontinence of urine are rare, and consciousness is maintained or replaced by a state of stupor or trance.
Dissociative anaesthesia and sensory loss

Anaesthetic areas of skin often have boundaries that make it clear that they are associated with the patient’s ideas about bodily functions, rather than medical knowledge. There may be differential loss between the sensory modalities that cannot be due to a neurological lesion. Sensory loss may be accompanied by complaints of paraesthesia. Loss of vision and hearing are rarely total in dissociative disorders.

Somatoform disorders

The main feature is repeated presentation of physical symptoms, together with persistent requests for medical investigations, in spite of repeated negative findings and reassurances by doctors that the symptoms have no physical basis. If any physical disorders are present, they do not explain the nature and extent of the symptoms or the distress and preoccupation of the patient.

Somatization disorder

The main features are multiple, recurrent and frequently changing physical symptoms of at least two years’ duration. Most patients have a long and complicated history of contact with both primary and specialist medical care services, during which many negative investigations or fruitless exploratory operations may have been carried out. Symptoms may be referred to any part or system of the body. The course of the disorder is chronic and fluctuating, and is often associated with
disruption of social, interpersonal and family behaviour. Short-lived (less than two years) and less striking symptom patterns should be classified under undifferentiated somatoform disorder (F45.1).

F45.1 Undifferentiated somatoform disorder

When somatoform complaints are multiple, varying and persistent, but the complete and typical clinical picture of somatization disorder is not fulfilled, the diagnosis of undifferentiated somatoform disorder should be considered.

Undifferentiated psychosomatic disorder

F45.2 Hypochondriacal disorder

The essential feature is a persistent preoccupation with the possibility of having one or more serious and progressive physical disorders. Patients manifest persistent somatic complaints or a persistent preoccupation with their physical appearance. Normal or commonplace sensations and appearances are often interpreted by patients as abnormal and distressing, and attention is usually focused upon only one or two organs or systems of the body. Marked depression and anxiety are often present, and may justify additional diagnoses.

F45.3 Somatoform autonomic dysfunction

Symptoms are presented by the patient as if they were due to a physical disorder of a system or organ that is largely or completely under autonomic innervation and control, i.e. the cardiovascular, gastrointestinal, respiratory and urogenital systems. The symptoms are usually of two types, neither of which indicates a physical disorder of the organ or system concerned. First, there are complaints based upon objective signs of autonomic arousal, such as palpitations, sweating, flushing, tremor and expression of fear and distress about the possibility of a physical disorder. Second, there are subjective complaints of a nonspecific or changing nature, such as fleeting aches and pains, sensations of burning, heaviness, tightness and feelings of being bloated or distended, which are referred by the patient to a specific organ or system.

F45.4 Persistent somatoform pain disorder

The predominant complaint is of persistent, severe and distressing pain, which cannot be explained fully by a physiological process or a physical disorder, and which occurs in association with emotional conflict or psychosocial problems that are sufficient to allow the conclusion that they are the main causative influences. The result is usually a marked increase in support and attention, either personal or medical. Pain presumed to be of psychogenic origin occurring during the course of depressive disorders or schizophrenia should not be included here.

CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F48 Other neurotic disorders

F48.0 Neurasthenia
Considerable cultural variations occur in the presentation of this disorder, and two main types occur, with substantial overlap. In one type, the main feature is a complaint of increased fatigue after mental effort, often associated with some decrease in occupational performance or coping efficiency in daily tasks. The mental fatigability is typically described as an unpleasant intrusion of distracting associations or recollections, difficulty in concentrating, and generally inefficient thinking. In the other type, the emphasis is on feelings of bodily or physical weakness and exhaustion after only minimal effort, accompanied by a feeling of muscular aches and pains and inability to relax. In both types, a variety of other unpleasant physical feelings is common, such as dizziness, tension headaches and feelings of general instability. Worry about decreasing mental and bodily well-being, irritability, anhedonia and varying minor degrees of both depression and anxiety are all common. Sleep is often disturbed in its initial and middle phases but hypersomnia may also be prominent.

        psychasthenia (F48.8)

F48.1 Depersonalization-derealization syndrome
A rare disorder in which the patient complains spontaneously that his or her mental activity, body and surroundings are changed in their quality, so as to be unreal, remote or automatized. Among the varied phenomena of the syndrome, patients complain most frequently of loss of emotions and feelings of estrangement or detachment from their thinking, their body or the real world. In spite of the dramatic nature of the experience, the patient is aware of the unreality of the change. The sensorium is normal and the capacity for emotional expression intact. Depersonalization-derealization symptoms may occur as part of a diagnosable schizophrenic, depressive, phobic or obsessive-compulsive disorder. In such cases, the diagnosis should be that of the main disorder.

Excl.: anorexia NOS (R63.0)
feeding:
• difficulties and mismanagement (R63.3)
• disorder of infancy or childhood (F98.2)
polyphagia (R63.2)

F50.0 Anorexia nervosa

A disorder characterized by deliberate weight loss, induced and sustained by the patient. It occurs most commonly in adolescent girls and young women, but adolescent boys and young men may also be affected, as may children approaching puberty and older women up to the menopause. The disorder is associated with a specific psychopathology whereby a dread of fatness and flabbiness of body contour persists as an intrusive overvalued idea, and the patients impose a low weight threshold on themselves. There is usually undernutrition of varying severity, with secondary endocrine and metabolic changes and disturbances of bodily function. The symptoms include restricted dietary choice, excessive exercise, induced vomiting and purgation, and use of appetite suppressants and diuretics.

Excl.: loss of appetite (R63.0)
loss of appetite
• psychogenic (F50.8)

F50.1 Atypical anorexia nervosa

Disorders that fulfillment some of the features of anorexia nervosa but in which the overall clinical picture does not justify that diagnosis. For instance, one of the key symptoms, such as amenorrhea or marked dread of being fat, may be absent, in the presence of marked weight loss and weight-reducing behaviour. This diagnosis should not be made in the presence of known physical disorders associated with weight loss.

F50.2 Bulimia nervosa

A syndrome characterized by repeated bouts of overeating and an excessive preoccupation with the control of body weight, leading to a pattern of overeating followed by vomiting or use of purgatives. This disorder shares many psychological features with anorexia nervosa, including an overconcern with body shape and weight. Repeated vomiting is likely to give rise to disturbances of body electrolytes and physical complications. There is often, but not always, a history of an earlier episode of anorexia nervosa, the interval ranging from a few months to several years.

Bulimia NOS
Hyperorexia nervosa
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F50.3 Atypical bulimia nervosa
Disorders that fulfil some of the features of bulimia nervosa, but in which the overall clinical picture does not justify that diagnosis. For instance, there may be recurrent bouts of overeating and overuse of purgatives without significant weight change, or the typical overconcern about body shape and weight may be absent.

F50.4 Overeating associated with other psychological disturbances
Overeating due to stressful events, such as bereavement, accident, childbirth, etc.
Psychogenic overeating
Excl.: obesity (E66.-)

F50.5 Vomiting associated with other psychological disturbances
Repeated vomiting that occurs in dissociative disorders (F44.-) and hypochondriacal disorder (F45.2), and that is not solely due to conditions classified outside this chapter. This subcategory may also be used in addition to O21.- (excessive vomiting in pregnancy) when emotional factors are predominant in the causation of recurrent nausea and vomiting in pregnancy.
Psychogenic vomiting
Excl.: nausea (R11)
Vomiting NOS (R11)

F50.8 Other eating disorders
Pica in adults
Psychogenic loss of appetite
Excl.: pica of infancy and childhood (F98.3)

F50.9 Eating disorder, unspecified

F51 Nonorganic sleep disorders
In many cases, a disturbance of sleep is one of the symptoms of another disorder, either mental or physical. Whether a sleep disorder in a given patient is an independent condition or simply one of the features of another disorder classified elsewhere, either in this chapter or in others, should be determined on the basis of its clinical presentation and course, as well as on the therapeutic considerations and priorities at the time of the consultation. Generally, if the sleep disorder is one of the major complaints and is perceived as a condition in itself, the present code should be used, along with other pertinent diagnoses describing the psychopathology and pathophysiology involved in a given case. This category includes only those sleep disorders in which emotional causes are considered to be a primary factor, and that are not due to identifiable physical disorders classified elsewhere.
Excl.: sleep disorders (organic) (G47.-)

F51.0 Nonorganic insomnia
A condition of unsatisfactory quantity and/or quality of sleep, which persists for a considerable period of time, including difficulty falling asleep, difficulty staying asleep, or early final wakening. Insomnia is a common symptom of many mental and physical disorders, and should be classified here in addition to the basic disorder only if it dominates the clinical picture.
Excl.: insomnia (organic) (G47.0)
F51.1 Nonorganic hypersomnia

Hypersomnia is defined as a condition of either excessive daytime sleepiness and sleep attacks (not accounted for by an inadequate amount of sleep) or prolonged transition to the fully aroused state upon awakening. In the absence of an organic factor for the occurrence of hypersomnia, this condition is usually associated with mental disorders.

_Excl._: hypersomnia (organic) (G47.1)
   narcolepsy (G47.4)

F51.2 Nonorganic disorder of the sleep–wake schedule

A lack of synchrony between the sleep-wake schedule and the desired sleep-wake schedule for the individual’s environment, resulting in a complaint of either insomnia or hypersomnia.

Psychogenic inversion of:
   • circadian
   • nyctohemeral
   • sleep

_Excl._: disorders of the sleep–wake schedule (organic) (G47.2)

F51.3 Sleepwalking [somnambulism]

A state of altered consciousness in which phenomena of sleep and wakefulness are combined. During a sleepwalking episode, the individual arises from bed, usually during the first third of nocturnal sleep, and walks about, exhibiting low levels of awareness, reactivity and motor skill. Upon awakening, there is usually no recall of the event.

F51.4 Sleep terrors [night terrors]

Nocturnal episodes of extreme terror and panic associated with intense vocalization, motility and high levels of autonomic discharge. The individual sits up or gets up, usually during the first third of nocturnal sleep, with a panicky scream. Quite often, he or she rushes to the door as if trying to escape, although very seldom leaves the room. Recall of the event, if any, is very limited (usually to one or two fragmentary mental images).

F51.5 Nightmares

Dream experiences loaded with anxiety or fear. There is very detailed recall of the dream content. The dream experience is very vivid and usually includes themes involving threats to survival, security or self-esteem. Quite often, there is a recurrence of the same or similar frightening nightmare themes. During a typical episode, there is a degree of autonomic discharge but no appreciable vocalization or body motility. Upon awakening, the individual rapidly becomes alert and oriented.

CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F52  Sexual dysfunction, not caused by organic disorder or disease

Sexual dysfunction covers the various ways in which an individual is unable to participate in a sexual relationship as he or she would wish. Sexual response is a psychosomatic process and both psychological and somatic processes are usually involved in the causation of sexual dysfunction.

Excl.: Dhat syndrome (F48.8)

F52.0  Lack or loss of sexual desire

Loss of sexual desire is the principal problem and is not secondary to other sexual difficulties, such as erectile failure or dyspareunia.

Frigidity
Hypoactive sexual desire disorder

F52.1  Sexual aversion and lack of sexual enjoyment

Either the prospect of sexual interaction produces sufficient fear or anxiety that sexual activity is avoided (sexual aversion) or sexual responses occur normally and orgasm is experienced but there is a lack of appropriate pleasure (lack of sexual enjoyment).

Anhedonia (sexual)

F52.2  Failure of genital response

The principal problem in men is erectile dysfunction (difficulty in developing or maintaining an erection suitable for satisfactory intercourse). In women, the principal problem is vaginal dryness or failure of lubrication.

Female sexual arousal disorder
Male erectile disorder
Psychogenic impotence

Excl.: impotence of organic origin (N48.4)

F52.3  Orgasmic dysfunction

Orgasm either does not occur or is markedly delayed.

Inhibited orgasm (male)(female)
Psychogenic anorgasmy

F52.4  Premature ejaculation

The inability to control ejaculation sufficiently for both partners to enjoy sexual interaction.

F52.5  Nonorganic vaginismus

Spasm of the pelvic floor muscles that surround the vagina, causing occlusion of the vaginal opening. Penile entry is either impossible or painful.

Psychogenic vaginismus

Excl.: vaginismus (organic) (N94.2)
F52.6 Nonorganic dyspareunia
Dyspareunia (or pain during sexual intercourse) occurs in both women and men. It can often be attributed to local pathology and should then properly be categorized under the pathological condition. This category is to be used only if there is no primary nonorganic sexual dysfunction (e.g. vaginismus or vaginal dryness).

Psychogenic dyspareunia

Excl.: dyspareunia (organic) (N94.1)

F52.7 Excessive sexual drive
Nymphomania
Satyriasis

F52.8 Other sexual dysfunction, not caused by organic disorder or disease

F52.9 Unspecified sexual dysfunction, not caused by organic disorder or disease

F53 Mental and behavioural disorders associated with the puerperium, not elsewhere classified
This category includes only mental disorders associated with the puerperium (commencing within six weeks of delivery) that do not meet the criteria for disorders classified elsewhere in this chapter, either because insufficient information is available, or because it is considered that special additional clinical features are present that make their classification elsewhere inappropriate.

F53.0 Mild mental and behavioural disorders associated with the puerperium, not elsewhere classified
Depression:
• postnatal NOS
• postpartum NOS

F53.1 Severe mental and behavioural disorders associated with the puerperium, not elsewhere classified
Puerperal psychosis NOS

F53.8 Other mental and behavioural disorders associated with the puerperium, not elsewhere classified

F53.9 Puerperal mental disorder, unspecified
Psychological and behavioural factors associated with disorders or diseases classified elsewhere

This category should be used to record the presence of psychological or behavioural influences thought to have played a major part in the etiology of physical disorders that can be classified to other chapters. Any resulting mental disturbances are usually mild, and often prolonged (such as worry, emotional conflict, apprehension), and do not of themselves justify the use of any of the categories in this chapter.

Incl.: psychological factors affecting physical conditions
examples of the use of this category are:
  • asthma F54 and J45.-
  • dermatitis F54 and L23–L25
  • gastric ulcer F54 and K25.-
  • irritable bowel syndrome F54 and K58.-
  • ulcerative colitis F54 and K51.-
  • urticaria F54 and L50.-

Use additional code, if desired, to identify the associated physical disorder.

Excl.: tension-type headache (G44.2)

Abuse of non-dependence-producing substances

A wide variety of medicaments and folk remedies may be involved, but the particularly important groups are: (a) psychotropic drugs that do not produce dependence, such as antidepressants, (b) laxatives, and (c) analgesics that may be purchased without medical prescription, such as aspirin and paracetamol.

Persistent use of these substances often involves unnecessary contacts with medical professionals or supporting staff, and is sometimes accompanied by harmful physical effects of the substances. Attempts to dissuade or forbid the use of the substance are often met with resistance; for laxatives and analgesics, this may be in spite of warnings about (or even the development of) physical harm such as renal dysfunction or electrolyte disturbances. Although it is usually clear that the patient has a strong motivation to take the substance, dependence or withdrawal symptoms do not develop as in the case of the psychoactive substances specified in F10–F19.

Incl.: abuse of:
  • antacids
  • herbal or folk remedies
  • steroids or hormones
  • vitamins
  • laxative habit

Excl.: abuse of psychoactive substances (F10-F19)

Unspecified behavioural syndromes associated with physiological disturbances and physical factors

Incl.: psychogenic physiological dysfunction NOS
Disorders of adult personality and behaviour
(F60–F69)

This block includes a variety of conditions and behaviour patterns of clinical significance that tend to be persistent and appear to be the expression of the individual’s characteristic lifestyle and mode of relating to himself or herself and others. Some of these conditions and patterns of behaviour emerge early in the course of individual development, as a result of both constitutional factors and social experience, while others are acquired later in life. Specific personality disorders (F60.-), mixed and other personality disorders (F61.-) and enduring personality changes (F62.-) are deeply ingrained and enduring behaviour patterns, manifesting as inflexible responses to a broad range of personal and social situations. They represent extreme or significant deviations from the way in which the average individual in a given culture perceives, thinks, feels and, particularly, relates to others. Such behaviour patterns tend to be stable and to encompass multiple domains of behaviour and psychological functioning. They are frequently, but not always, associated with various degrees of subjective distress and problems of social performance.

F60 Specific personality disorders

These are severe disturbances in the personality and behavioural tendencies of the individual; not directly resulting from disease, damage or other insult to the brain, or from another psychiatric disorder; usually involving several areas of the personality; nearly always associated with considerable personal distress and social disruption; and usually manifest since childhood or adolescence and continuing throughout adulthood.

F60.0 Paranoid personality disorder

Personality disorder characterized by excessive sensitivity to setbacks; unforgiveness of insults; suspiciousness and a tendency to distort experience by misconstruing the neutral or friendly actions of others as hostile or contemptuous; recurrent suspicions, without justification, regarding the sexual fidelity of the spouse or sexual partner; and a combative and tenacious sense of personal rights. There may be excessive self-importance and there is often excessive self-reference.

Personality (disorder):
• expansive paranoid
• fanatic
• querulant
• paranoid
• sensitive paranoid

Excl.: paranoia (F22.0)
paranoia querulans (F22.8)
paranoid:
• psychosis (F22.0)
• schizophrenia (F20.0)
• state (F22.0)
**F60.1  Schizoid personality disorder**

Personality disorder characterized by withdrawal from affectional, social and other contacts, with preference for fantasy, solitary activities and introspection. There is a limited capacity to express feelings and to experience pleasure.

*Excl.:* Asperger syndrome (F84.5)
  delusional disorder (F22.0)
  schizoid disorder of childhood (F84.5)
  schizophrenia (F20.-)
  schizotypal disorder (F21)

**F60.2  Dissocial personality disorder**

Personality disorder characterized by disregard for social obligations, and callous unconcern for the feelings of others. There is gross disparity between behaviour and the prevailing social norms. Behaviour is not readily modifiable by adverse experience, including punishment. There is a low tolerance to frustration and a low threshold for discharge of aggression, including violence; there is a tendency to blame others, or to offer plausible rationalizations for the behaviour, bringing the patient into conflict with society.

Personality (disorder):
- amoral
- antisocial
- asocial
- psychopathic
- sociopathic

*Excl.:* conduct disorders (F91.-)
  emotionally unstable personality disorder (F60.3)

**F60.3  Emotionally unstable personality disorder**

Personality disorder characterized by a definite tendency to act impulsively and without consideration of the consequences; the mood is unpredictable and capricious. There is a liability to outbursts of emotion and an incapacity to control the behavioural explosions. There is a tendency to quarrelsome behaviour and to conflicts with others, especially when impulsive acts are thwarted or censored. Two types may be distinguished: the impulsive type, characterized predominantly by emotional instability and lack of impulse control, and the borderline type, characterized in addition by disturbances in self-image, aims and internal preferences, by chronic feelings of emptiness, by intense and unstable interpersonal relationships, and by a tendency to self-destructive behaviour, including suicide gestures and attempts.

Personality (disorder):
- aggressive
- borderline
- explosive

*Excl.:* dissocial personality disorder (F60.2)
F60.4  **Histrionic personality disorder**
Personality disorder characterized by shallow and labile affectivity, self-dramatization, theatricality, exaggerated expression of emotions, suggestibility, egocentricity, self-indulgence, lack of consideration for others, easily hurt feelings, and continuous seeking for appreciation, excitement and attention.

Personality (disorder):
- hysterical
- psychoinfantile

F60.5  **Anankastic personality disorder**
Personality disorder characterized by feelings of doubt, perfectionism, excessive conscientiousness, checking and preoccupation with details, stubbornness, caution, and rigidity. There may be insistent and unwelcome thoughts or impulses that do not attain the severity of an obsessive-compulsive disorder.

Personality (disorder):
- compulsive
- obsessional
- obsessive-compulsive

*Excl.*: obsessive-compulsive disorder (F42.-)

F60.6  **Anxious [avoidant] personality disorder**
Personality disorder characterized by feelings of tension and apprehension, insecurity and inferiority. There is a continuous yearning to be liked and accepted, a hypersensitivity to rejection and criticism, with restricted personal attachments, and a tendency to avoid certain activities by habitual exaggeration of the potential dangers or risks in everyday situations.

F60.7  **Dependent personality disorder**
Personality disorder characterized by pervasive passive reliance on other people to make one’s major and minor life decisions, great fear of abandonment, feelings of helplessness and incompetence, passive compliance with the wishes of elders and others, and a weak response to the demands of daily life. Lack of vigour may show itself in the intellectual or emotional spheres; there is often a tendency to transfer responsibility to others.

Personality (disorder):
- asthenic
- inadequate
- passive
- self-defeating

F60.8  **Other specific personality disorders**
Personality (disorder):
- eccentric
- ‘haltlose’ type
- immature
- narcissistic
- passive-aggressive
- psychoneurotic

MENTAL AND BEHAVIOURAL DISORDERS

F60.9 Personality disorder, unspecified
Character neurosis NOS
Pathological personality NOS

F61 Mixed and other personality disorders
This category is intended for personality disorders that are often troublesome but do not demonstrate the specific pattern of symptoms that characterize the disorders described in F60.-. As a result, they are often more difficult to diagnose than the disorders in F60.-.

Examples include:

• mixed personality disorders with features of several of the disorders in F60.- but without a predominant set of symptoms that would allow a more specific diagnosis;

• troublesome personality changes, not classifiable to F60.- or F62.-, and regarded as secondary to a main diagnosis of a coexisting affective or anxiety disorder.

Excl.: accentuated personality traits (Z73.1)

F62 Enduring personality changes, not attributable to brain damage and disease
Disorders of adult personality and behaviour that have developed in persons with no previous personality disorder, following exposure to catastrophic or excessive prolonged stress, or following a severe psychiatric illness. These diagnoses should be made only when there is evidence of a definite and enduring change in a person’s pattern of perceiving, relating to or thinking about the environment and himself or herself. The personality change should be significant and be associated with inflexible and maladaptive behaviour not present before the pathogenic experience. The change should not be a direct manifestation of another mental disorder or a residual symptom of any antecedent mental disorder.

Excl.: personality and behavioural disorder due to brain disease, damage and dysfunction (F07.-)

F62.0 Enduring personality change after catastrophic experience
Enduring personality change, present for at least two years, following exposure to catastrophic stress. The stress must be so extreme that it is not necessary to consider personal vulnerability in order to explain its profound effect on the personality. The disorder is characterized by a hostile or distrustful attitude toward the world, social withdrawal, feelings of emptiness or hopelessness, a chronic feeling of ‘being on edge’ as if constantly threatened, and estrangement. Post-traumatic stress disorder (F43.1) may precede this type of personality change.

Personality change after:

• concentration camp experiences
• disasters
• prolonged:
  – captivity with an imminent possibility of being killed
  – exposure to life-threatening situations such as being a victim of terrorism
• torture

Excl.: post-traumatic stress disorder (F43.1)
INTERNATIONAL CLASSIFICATION OF DISEASES

F62.1  Enduring personality change after psychiatric illness
Personality change, persisting for at least two years, attributable to the traumatic experience of suffering from a severe psychiatric illness. The change cannot be explained by a previous personality disorder and should be differentiated from residual schizophrenia and other states of incomplete recovery from an antecedent mental disorder. This disorder is characterized by an excessive dependence on and a demanding attitude towards others; conviction of being changed or stigmatized by the illness, leading to an inability to form and maintain close and confiding personal relationships and to social isolation; passivity, reduced interests, and diminished involvement in leisure activities; persistent complaints of being ill, which may be associated with hypochondriacal claims and illness behaviour; dysphoric or labile mood, not due to the presence of a current mental disorder or antecedent mental disorder with residual affective symptoms; and longstanding problems in social and occupational functioning.

F62.8  Other enduring personality changes
Chronic pain personality syndrome

F62.9  Enduring personality change, unspecified

F63  Habit and impulse disorders
This category includes certain disorders of behaviour that are not classifiable under other categories. They are characterized by repeated acts that have no clear rational motivation, cannot be controlled, and generally harm the patient’s own interests and those of other people. The patient reports that the behaviour is associated with impulses to action. The cause of these disorders is not understood and they are grouped together because of broad descriptive similarities, not because they are known to share any other important features.

_Excl._: habitual excessive use of alcohol or psychoactive substances
(F10–F19)
impulse and habit disorders involving sexual behaviour (F65.-)

F63.0  Pathological gambling
The disorder consists of frequent, repeated episodes of gambling that dominate the patient’s life to the detriment of social, occupational, material and family values and commitments.

Compulsive gambling

_Excl._: excessive gambling by manic patients (F30.-)
gambling and betting NOS (Z72.6)
gambling in dissocial personality disorder (F60.2)

F63.1  Pathological fire-setting [pyromania]
Disorder characterized by multiple acts of, or attempts at, setting fire to property or other objects, without apparent motive, and by a persistent preoccupation with subjects related to fire and burning. This behaviour is often associated with feelings of increasing tension before the act, and intense excitement immediately afterwards.

_Excl._: fire-setting (by)(in):
• adult with dissocial personality disorder (F60.2)
• alcohol or psychoactive substance intoxication (F10–F19, with common fourth character .0)
• as the reason for observation for suspected mental disorder (Z03.2)
• conduct disorders (F91.-)
• organic mental disorders (F00–F09)
• schizophrenia (F20.-)

F63.2 Pathological stealing [kleptomania]
Disorder characterized by repeated failure to resist impulses to steal objects that are not acquired for personal use or monetary gain. The objects may instead be discarded, given away or hoarded. This behaviour is usually accompanied by an increasing sense of tension before, and a sense of gratification during and immediately after, the act.

Excl.: depressive disorder with stealing (F31–F33)
organic mental disorders (F00–F09)
shoplifting as the reason for observation for suspected mental disorder (Z03.2)

F63.3 Trichotillomania
A disorder characterized by noticeable hair loss due to a recurrent failure to resist impulses to pull out hairs. The hair-pulling is usually preceded by mounting tension and is followed by a sense of relief or gratification. This diagnosis should not be made if there is a pre-existing inflammation of the skin, or if the hair-pulling is in response to a delusion or a hallucination.

Excl.: stereotyped movement disorder with hair-plucking (F98.4)

F63.8 Other habit and impulse disorders
Other kinds of persistently repeated maladaptive behaviour that are not secondary to a recognized psychiatric syndrome, and in which it appears that the patient is repeatedly failing to resist impulses to carry out the behaviour. There is a prodromal period of tension with a feeling of release at the time of the act.

Intermittent explosive disorder

F63.9 Habit and impulse disorder, unspecified

F64 Gender identity disorders

F64.0 Transsexualism
A desire to live and be accepted as a member of the opposite sex, usually accompanied by a sense of discomfort with, or inappropriateness of, one’s anatomic sex, and a wish to have surgery and hormonal treatment to make one’s body as congruent as possible with one’s preferred sex.

F64.1 Dual-role transvestism
The wearing of clothes of the opposite sex for part of the individual’s existence, in order to enjoy the temporary experience of membership of the opposite sex, but without any desire for a more permanent sex change or associated surgical reassignment, and without sexual excitement accompanying the cross-dressing.

Gender identity disorder of adolescence or adulthood, nontranssexual type

Excl.: fetishistic transvestism (F65.1)
F64.2 Gender identity disorder of childhood
A disorder, usually first manifest during early childhood (and always well before puberty), characterized by a persistent and intense distress about assigned sex, together with a desire to be (or insistence that one is) of the other sex. There is a persistent preoccupation with the dress and activities of the opposite sex and repudiation of the individual’s own sex. The diagnosis requires a profound disturbance of the normal gender identity; mere tomboyishness in girls or girlish behaviour in boys is not sufficient. Gender identity disorders in individuals who have reached or are entering puberty should not be classified here but in F66.-.

Excl.: egodystonic sexual orientation (F66.1)
sexual maturation disorder (F66.0)

F64.8 Other gender identity disorders
F64.9 Gender identity disorder, unspecified
Gender role disorder NOS

F65 Disorders of sexual preference
Incl.: paraphilias

F65.0 Fetishism
Reliance on some non-living object as a stimulus for sexual arousal and sexual gratification. Many fetishes are extensions of the human body, such as articles of clothing or footwear. Other common examples are characterized by some particular texture such as rubber, plastic or leather. Fetish objects vary in their importance to the individual. In some cases they simply serve to enhance sexual excitement achieved in ordinary ways (e.g. having the partner wear a particular garment).

F65.1 Fetishistic transvestism
The wearing of clothes of the opposite sex principally to obtain sexual excitement and to create the appearance of a person of the opposite sex. Fetishistic transvestism is distinguished from transsexual transvestism by its clear association with sexual arousal and the strong desire to remove the clothing once orgasm occurs and sexual arousal declines. It can occur as an earlier phase in the development of transsexualism.

Transvestic fetishism

F65.2 Exhibitionism
A recurrent or persistent tendency to expose the genitalia to strangers (usually of the opposite sex) or to people in public places, without inviting or intending closer contact. There is usually, but not invariably, sexual excitement at the time of the exposure and the act is commonly followed by masturbation.

F65.3 Voyeurism
A recurrent or persistent tendency to look at people engaging in sexual or intimate behaviour such as undressing. This is carried out without the observed people being aware, and usually leads to sexual excitement and masturbation.

F65.4 Paedophilia
A sexual preference for children, boys or girls or both, usually of prepubertal or early pubertal age.
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F65.5 Sadomasochism
A preference for sexual activity that involves the infliction of pain or humiliation, or bondage. If the subject prefers to be the recipient of such stimulation, this is called masochism; if the provider, sadism. Often an individual obtains sexual excitement from both sadistic and masochistic activities.

Masochism
Sadism

F65.6 Multiple disorders of sexual preference
Sometimes more than one abnormal sexual preference occurs in one person and there is none of first rank. The most common combination is fetishism, transvestism and sadomasochism.

F65.8 Other disorders of sexual preference
A variety of other patterns of sexual preference and activity, including making obscene telephone calls, rubbing up against people for sexual stimulation in crowded public places, sexual activity with animals, and use of strangulation or anoxia for intensifying sexual excitement.

Frotteurism
Necrophilia

F65.9 Disorder of sexual preference, unspecified
Sexual deviation NOS

F66 Psychological and behavioural disorders associated with sexual development and orientation
Note: Sexual orientation by itself is not to be regarded as a disorder.

F66.0 Sexual maturation disorder
The patient suffers from uncertainty about his or her gender identity or sexual orientation, which causes anxiety or depression. Most commonly this occurs in adolescents who are not certain whether they are homosexual, heterosexual or bisexual in orientation, or in individuals who, after a period of apparently stable sexual orientation (often within a long-standing relationship), find that their sexual orientation is changing.

F66.1 Egodystonic sexual orientation
The gender identity or sexual preference (heterosexual, homosexual, bisexual or prepubertal) is not in doubt, but the individual wishes it were different because of associated psychological and behavioural disorders, and may seek treatment in order to change it.

F66.2 Sexual relationship disorder
The gender identity or sexual orientation (heterosexual, homosexual or bisexual) is responsible for difficulties in forming or maintaining a relationship with a sexual partner.

F66.8 Other psychosexual development disorders
F66.9 Psychosexual development disorder, unspecified
F68 Other disorders of adult personality and behaviour

F68.0 Elaboration of physical symptoms for psychological reasons
Physical symptoms compatible with and originally due to a confirmed physical disorder, disease or disability become exaggerated or prolonged, due to the psychological state of the patient. The patient is commonly distressed by this pain or disability, and is often preoccupied with worries, which may be justified, of the possibility of prolonged or progressive disability or pain.

Compensation neurosis

F68.1 Intentional production or feigning of symptoms or disabilities, either physical or psychological [factitious disorder]
The patient feigns symptoms repeatedly for no obvious reason and may even inflict self-harm in order to produce symptoms or signs. The motivation is obscure and presumably internal with the aim of adopting the sick role. The disorder is often combined with marked disorders of personality and relationships.

Hospital hopper syndrome
Münchausen syndrome
Peregrinating patient

Excl.: factitial dermatitis (L98.1)
person feigning illness (with obvious motivation) (Z76.5)

F68.8 Other specified disorders of adult personality and behaviour
Character disorder NOS
Relationship disorder NOS

F69 Unspecified disorder of adult personality and behaviour

Mental retardation (F70–F79)
A condition of arrested or incomplete development of the mind, which is especially characterized by impairment of skills manifested during the developmental period, skills which contribute to the overall level of intelligence, i.e. cognitive, language, motor and social abilities. Retardation can occur with or without any other mental or physical condition.

Degrees of mental retardation are conventionally estimated by standardized intelligence tests. These can be supplemented by scales assessing social adaptation in a given environment. These measures provide an approximate indication of the degree of mental retardation. The diagnosis will also depend on the overall assessment of intellectual functioning by a skilled diagnostician.

Intellectual abilities and social adaptation may change over time, and, however poor, may improve as a result of training and rehabilitation. Diagnosis should be based on the current levels of functioning.

Use additional code, if desired, to identify associated conditions such as autism, other developmental disorders, epilepsy, conduct disorders or severe physical handicap.
The following fourth-character subdivisions are for use with categories F70–F79 to identify the extent of impairment of behaviour:

.0 With the statement of no, or minimal, impairment of behaviour

.1 Significant impairment of behaviour requiring attention or treatment

.8 Other impairments of behaviour

.9 Without mention of impairment of behaviour

F70 **Mild mental retardation**

[See before F70 for subdivisions]

Approximate IQ range of 50 to 69 (in adults, mental age from 9 to under 12 years). Likely to result in some learning difficulties in school. Many adults will be able to work and maintain good social relationships and contribute to society.

*Incl.*: feeble-mindedness

  mild mental subnormality

F71 **Moderate mental retardation**

[See before F70 for subdivisions]

Approximate IQ range of 35 to 49 (in adults, mental age from 6 to under 9 years). Likely to result in marked developmental delays in childhood but most can learn to develop some degree of independence in self-care and acquire adequate communication and academic skills. Adults will need varying degrees of support to live and work in the community.

*Incl.*: moderate mental subnormality

F72 **Severe mental retardation**

[See before F70 for subdivisions]

Approximate IQ range of 20 to 34 (in adults, mental age from 3 to under 6 years). Likely to result in continuous need of support.

*Incl.*: severe mental subnormality

F73 **Profound mental retardation**

[See before F70 for subdivisions]

Disorders of psychological development (F80–F89)

The disorders included in this block have in common: (a) onset invariably during infancy or childhood; (b) impairment or delay in development of functions that are strongly related to biological maturation of the central nervous system; and (c) a steady course without remissions and relapses. In most cases, the functions affected include language, visuo-spatial skills and motor coordination. Usually, the delay or impairment has been present from as early as it could be detected reliably and will diminish progressively as the child grows older, although milder deficits often remain in adult life.

F80 Specific developmental disorders of speech and language

Disorders in which normal patterns of language acquisition are disturbed from the early stages of development. The conditions are not directly attributable to neurological or speech-mechanism abnormalities, sensory impairments, mental retardation or environmental factors. Specific developmental disorders of speech and language are often followed by associated problems, such as difficulties in reading and spelling, abnormalities in interpersonal relationships, and emotional and behavioural disorders.

F80.0 Specific speech articulation disorder

A specific developmental disorder in which the child’s use of speech sounds is below the appropriate level for its mental age, but in which there is a normal level of language skills.

- mental retardation (F70–F79)
- with language developmental disorder:
  - expressive (F80.1)
  - receptive (F80.2)

F80.1 Expressive language disorder

A specific developmental disorder in which the child’s ability to use expressive spoken language is markedly below the appropriate level for its mental age, but in which language comprehension is within normal limits. There may or may not be abnormalities in articulation.

Developmental dysphasia or aphasia, expressive type

pervasive developmental disorders (F84.-)

**F80.2 Receptive language disorder**
A specific developmental disorder in which the child’s understanding of language is below the appropriate level for its mental age. In virtually all cases expressive language will also be markedly affected and abnormalities in word-sound production are common.

Congenital auditory imperception
Developmental:
  • dysphasia or aphasia, receptive type

elective mutism (F94.0)
language delay due to deafness (H90–H91)
mental retardation (F70–F79)

**F80.3 Acquired aphasia with epilepsy [Landau–Kleffner]**
A disorder in which the child, having previously made normal progress in language development, loses both receptive and expressive language skills but retains general intelligence; the onset of the disorder is accompanied by paroxysmal abnormalities on the EEG, and, in the majority of cases, also by epileptic seizures. Usually the onset is between the ages of three and seven years, with skills being lost over days or weeks. The temporal association between the onset of seizures and loss of language is variable, with one preceding the other (either way round) by a few months to two years. An inflammatory encephalitictic process has been suggested as a possible cause of this disorder. About two thirds of patients are left with a more or less severe receptive language deficit.

**Excl.:** aphasia (due to):
  • NOS (R47.0)
  • autism (F84.0–F84.1)
  • disintegrative disorders of childhood (F84.2–F84.3)

Lisping

**F80.9 Developmental disorder of speech and language, unspecified**
Language disorder NOS
Specific developmental disorders of scholastic skills

Disorders in which the normal patterns of skill acquisition are disturbed from the early stages of development. This is not simply a consequence of a lack of opportunity to learn, it is not solely a result of mental retardation, and it is not due to any form of acquired brain trauma or disease.

Specific reading disorder

The main feature is a specific and significant impairment in the development of reading skills that is not solely accounted for by mental age, visual acuity problems or inadequate schooling. Reading comprehension skill, reading word recognition, oral reading skill and performance of tasks requiring reading may all be affected. Spelling difficulties are frequently associated with specific reading disorder and often remain into adolescence, even after some progress in reading has been made. Specific developmental disorders of reading are commonly preceded by a history of disorders in speech or language development. Associated emotional and behavioural disturbances are common during the school age period.

‘Backward reading’
Developmental dyslexia
Specific reading retardation

Excl.: alexia NOS (R48.0)
      dyslexia NOS (R48.0)
      reading difficulties secondary to emotional disorders (F93.-)

Specific spelling disorder

The main feature is a specific and significant impairment in the development of spelling skills, in the absence of a history of specific reading disorder, which is not solely accounted for by low mental age, visual acuity problems or inadequate schooling. The abilities to spell orally and to write out words correctly are both affected.
Specific spelling retardation (without reading disorder)

Excl.: agraphia NOS (R48.8)
      spelling difficulties:
      • associated with a reading disorder (F81.0)
      • due to inadequate teaching (Z55.8)

Specific disorder of arithmetical skills

Involves a specific impairment in arithmetical skills that is not solely explicable on the basis of general mental retardation or of inadequate schooling. The deficit concerns mastery of basic computational skills of addition, subtraction, multiplication and division, rather than of the more abstract mathematical skills involved in algebra, trigonometry, geometry or calculus.

Developmental:
• acalculia
• arithmetical disorder
• Gerstmann’s syndrome

Excl.: acalculia NOS (R48.8)
      arithmetical difficulties:
      • associated with a reading or spelling disorder (F81.3)
      • due to inadequate teaching (Z55.8)
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F81.3  Mixed disorder of scholastic skills
An ill-defined residual category of disorders in which both arithmetical and reading or spelling skills are significantly impaired, but in which the disorder is not solely explicable in terms of general mental retardation or of inadequate schooling. It should be used for disorders meeting the criteria for both F81.2 and either F81.0 or F81.1.

_Excl._ specific:
- disorder of arithmetical skills (F81.2)
- reading disorder (F81.0)
- spelling disorder (F81.1)

F82  Specific developmental disorder of motor function
A disorder in which the main feature is a serious impairment in the development of motor coordination that is not solely explicable in terms of general intellectual retardation or of any specific congenital or acquired neurological disorder. Nevertheless, in most cases, a careful clinical examination shows marked neurodevelopmental immaturities such as choreiform movements of unsupported limbs or mirror movements and other associated motor features, as well as signs of impaired fine and gross motor coordination.

_Incl._:
- clumsy child syndrome
developmental:
  - coordination disorder
  - dyspraxia

_Excl._:
- abnormalities of gait and mobility (R26.-)
  lack of coordination (R27.-)
- lack of coordination
  - secondary to mental retardation (F70–F79)

F83  Mixed specific developmental disorders
A residual category for disorders in which there is some admixture of specific developmental disorders of speech and language, of scholastic skills, and of motor function, but in which none predominates sufficiently to constitute the prime diagnosis. This mixed category should be used only when there is a major overlap between each of these specific developmental disorders. The disorders are usually, but not always, associated with some degree of general impairment of cognitive functions. Thus, the category should be used when there are dysfunctions meeting the criteria for two or more of F80.-, F81.- and F82.
**INTERNATIONAL CLASSIFICATION OF DISEASES**

**F84**  
**Pervasive developmental disorders**  
A group of disorders characterized by qualitative abnormalities in reciprocal social interactions and in patterns of communication, and by a restricted, stereotyped, repetitive repertoire of interests and activities. These qualitative abnormalities are a pervasive feature of the individual’s functioning in all situations.

Use additional code, if desired, to identify any associated medical condition and mental retardation.

**F84.0**  
**Childhood autism**  
A type of pervasive developmental disorder that is defined by: (a) the presence of abnormal or impaired development that is manifest before the age of three years, and (b) the characteristic type of abnormal functioning in all the three areas of psychopathology: reciprocal social interaction, communication and restricted, stereotyped, repetitive behaviour. In addition to these specific diagnostic features, a range of other nonspecific problems are common, such as phobias, sleeping and eating disturbances, temper tantrums and (self-directed) aggression.

Autistic disorder  
Infantile:  
• autism  
• psychosis  
Kanner syndrome

*Excl.*: autistic psychopathy (F84.5)

**F84.1**  
**Atypical autism**  
A type of pervasive developmental disorder that differs from childhood autism, either in age of onset or in failing to fulfil all three sets of diagnostic criteria. This subcategory should be used when there is abnormal and impaired development that is present only after age three years, and a lack of sufficient demonstrable abnormalities in one or two of the three areas of psychopathology required for the diagnosis of autism (namely, reciprocal social interactions, communication and restricted, stereotyped, repetitive behaviour) in spite of characteristic abnormalities in the other area(s). Atypical autism arises most often in profoundly retarded individuals and in individuals with a severe specific developmental disorder of receptive language.

Atypical childhood psychosis  
Mental retardation with autistic features

Use additional code (F70–F79), if desired, to identify mental retardation.

**F84.2**  
**Rett syndrome**  
A condition, so far found only in girls, in which apparently normal early development is followed by partial or complete loss of speech and of skills in locomotion and use of hands, together with deceleration in head growth, usually with an onset between seven and 24 months of age. Loss of purposeful hand movements, hand-wringer stereotypes, and hyperventilation are characteristic. Social and play development are arrested but social interest tends to be maintained. Trunk ataxia and apraxia start to develop by age four years and choreoathetoid movements frequently follow. Severe mental retardation almost invariably results.
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F84.3 Other childhood disintegrative disorder
A type of pervasive developmental disorder that is defined by a period of entirely normal development before the onset of the disorder, followed by a definite loss of previously acquired skills in several areas of development over the course of a few months. Typically, this is accompanied by a general loss of interest in the environment, by stereotyped, repetitive motor mannerisms, and by autistic-like abnormalities in social interaction and communication. In some cases the disorder can be shown to be due to some associated encephalopathy but the diagnosis should be made on the behavioural features.

Dementia infantilis
Disintegrative psychosis
Heller syndrome
Symbiotic psychosis

Use additional code, if desired, to identify any associated neurological condition.

Excl.: Rett syndrome (F84.2)

F84.4 Overactive disorder associated with mental retardation and stereotyped movements
An ill-defined disorder of uncertain nosological validity. The category is designed to include a group of children with severe mental retardation (IQ below 35) who show major problems in hyperactivity and in attention, as well as stereotyped behaviours. They tend not to benefit from stimulant drugs (unlike those with an IQ in the normal range) and may exhibit a severe dysphoric reaction (sometimes with psychomotor retardation) when given stimulants. In adolescence, the overactivity tends to be replaced by underactivity (a pattern that is not usual in hyperkinetic children with normal intelligence). This syndrome is also often associated with a variety of developmental delays, either specific or global. The extent to which the behavioural pattern is a function of low IQ or of organic brain damage is not known.

F84.5 Asperger syndrome
A disorder of uncertain nosological validity, characterized by the same type of qualitative abnormalities of reciprocal social interaction that typify autism, together with a restricted, stereotyped, repetitive repertoire of interests and activities. It differs from autism primarily in the fact that there is no general delay or retardation in language or in cognitive development. This disorder is often associated with marked clumsiness. There is a strong tendency for the abnormalities to persist into adolescence and adult life. Psychotic episodes occasionally occur in early adult life.

Autistic psychopathy
Schizoid disorder of childhood

F84.8 Other pervasive developmental disorders
F84.9 Pervasive developmental disorder, unspecified

F88 Other disorders of psychological development
Incl.: developmental agnosia

F89 Unspecified disorder of psychological development
Incl.: developmental disorder NOS
Behavioural and emotional disorders with onset usually occurring in childhood and adolescence (F90–F98)

F90  Hyperkinetic disorders

A group of disorders characterized by an early onset (usually in the first five years of life), lack of persistence in activities that require cognitive involvement, and a tendency to move from one activity to another without completing any one, together with disorganized, ill-regulated, and excessive activity. Several other abnormalities may be associated. Hyperkinetic children are often reckless, impulsive and prone to accidents, and find themselves in disciplinary trouble because of unthinking breaches of rules rather than deliberate defiance. Their relationships with adults are often socially disinhibited, with a lack of normal caution and reserve. They are unpopular with other children and may become isolated. Impairment of cognitive functions is common, and specific delays in motor and language development are disproportionately frequent. Secondary complications include dissocial behaviour and low self-esteem.

Hyperkinetic syndrome NOS

F91  Conduct disorders

Disorders characterized by a repetitive and persistent pattern of dissocial, aggressive or defiant conduct. Such behaviour should amount to major violations of age-appropriate social expectations; it should therefore be more severe than ordinary childish mischief or adolescent rebelliousness and should imply an enduring pattern of behaviour (six months or longer). Features of conduct disorder can also be symptomatic of other psychiatric conditions, in which case the underlying diagnosis should be preferred.
Examples of the behaviours on which the diagnosis is based include excessive levels of fighting or bullying, cruelty to other people or animals, severe destructiveness to property, fire-setting, stealing, repeated lying, truancy from school and running away from home, unusually frequent and severe temper tantrums, and disobedience. Any one of these behaviours, if marked, is sufficient for the diagnosis, but isolated dissocial acts are not.

Excl.: mood [affective] (F30–F39) perseverative developmental disorders (F84.-) schizophrenia (F20.-) when associated with:
  • emotional disorders (F92.-)
  • hyperkinetic disorders (F90.1)

F91.0 Conduct disorder confined to the family context
Conduct disorder involving dissocial or aggressive behaviour (and not merely oppositional, defiant, disruptive behaviour), in which the abnormal behaviour is entirely, or almost entirely, confined to the home and to interactions with members of the nuclear family or immediate household. The disorder requires that the overall criteria for F91.- be met; even severely disturbed parent–child relationships are not of themselves sufficient for diagnosis.

F91.1 Unsocialized conduct disorder
Disorder characterized by the combination of persistent dissocial or aggressive behaviour (meeting the overall criteria for F91.- and not merely comprising oppositional, defiant, disruptive behaviour) with significant pervasive abnormalities in the individual’s relationships with other children.

Conduct disorder, solitary aggressive type
Unsocialized aggressive disorder

F91.2 Socialized conduct disorder
Disorder involving persistent dissocial or aggressive behaviour (meeting the overall criteria for F91.- and not merely comprising oppositional, defiant, disruptive behaviour) occurring in individuals who are generally well integrated into their peer group.

Conduct disorder, group type
Group delinquency
Offences in the context of gang membership
Stealing in company with others
Truancy from school

F91.3 Oppositional defiant disorder
Conduct disorder, usually occurring in younger children, primarily characterized by markedly defiant, disobedient, disruptive behaviour that does not include delinquent acts or the more extreme forms of aggressive or dissocial behaviour. The disorder requires that the overall criteria for F91.- be met; even severely mischievous or naughty behaviour is not in itself sufficient for diagnosis. Caution should be employed before using this category, especially with older children, because clinically significant conduct disorder will usually be accompanied by dissocial or aggressive behaviour that goes beyond mere defiance, disobedience or disruptiveness.
INTERNATIONAL CLASSIFICATION OF DISEASES

F91.8  Other conduct disorders
F91.9  Conduct disorder, unspecified
Childhood:
  • behavioural disorder NOS
  • conduct disorder NOS

F92  Mixed disorders of conduct and emotions
A group of disorders characterized by the combination of persistently aggressive, dissocial or defiant behaviour with overt and marked symptoms of depression, anxiety or other emotional upsets. The criteria for both conduct disorders of childhood (F91.-) and emotional disorders of childhood (F93.-) or an adult-type neurotic diagnosis (F40–F48) or a mood disorder (F30–F39) must be met.

F92.0  Depressive conduct disorder
This category requires the combination of conduct disorder (F91.-) with persistent and marked depression of mood (F32.-), as demonstrated by symptoms such as excessive misery, loss of interest and pleasure in usual activities, self-blame and hopelessness; disturbances of sleep or appetite may also be present.

Conduct disorder in F91.- associated with depressive disorder in F32.-

F92.8  Other mixed disorders of conduct and emotions
This category requires the combination of conduct disorder (F91.-) with persistent and marked emotional symptoms such as anxiety, obsessions or compulsions, depersonalization or derealization, phobias or hypochondriasis.

Conduct disorder in F91.- associated with:
  • emotional disorder in F93.-
  • neurotic disorder in F40–F48

F92.9  Mixed disorder of conduct and emotions, unspecified

F93  Emotional disorders with onset specific to childhood
Mainly exaggerations of normal developmental trends rather than phenomena that are qualitatively abnormal in themselves. Developmental appropriateness is used as the key diagnostic feature in defining the difference between these emotional disorders, with onset specific to childhood, and the neurotic disorders (F40–F48).

Excl.: when associated with conduct disorder (F92.-)

F93.0  Separation anxiety disorder of childhood
Should be diagnosed when fear of separation constitutes the focus of the anxiety and when such anxiety first arose during the early years of childhood. It is differentiated from normal separation anxiety when it is of a degree (severity) that is statistically unusual (including an abnormal persistence beyond the usual age period), and when it is associated with significant problems in social functioning.

Excl.: mood [affective] disorders (F30–F39)
neurotic disorders (F40–F48)
phobic anxiety disorder of childhood (F93.1)
social anxiety disorder of childhood (F93.2)
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F93.1 Phobic anxiety disorder of childhood
Fears in childhood that show a marked developmental-phase specificity and arise (to some extent) in a majority of children, but that are abnormal in degree. Other fears that arise in childhood but that are not a normal part of psychosocial development (for example agoraphobia) should be coded under the appropriate category in section F40–F48.

Excl.: generalized anxiety disorder (F41.1)

F93.2 Social anxiety disorder of childhood
In this disorder there is a wariness of strangers and social apprehension or anxiety when encountering new, strange or socially threatening situations. This category should be used only where such fears arise during the early years, and are both unusual in degree and accompanied by problems in social functioning.

Avoidant disorder of childhood or adolescence

F93.3 Sibling rivalry disorder
Some degree of emotional disturbance usually following the birth of an immediately younger sibling is shown by a majority of young children. A sibling rivalry disorder should be diagnosed only if the degree or persistence of the disturbance is both statistically unusual and associated with abnormalities of social interaction.

Sibling jealousy

F93.8 Other childhood emotional disorders
Identity disorder
Overanxious disorder

Excl.: gender identity disorder of childhood (F64.2)

F93.9 Childhood emotional disorder, unspecified

F94 Disorders of social functioning with onset specific to childhood and adolescence
A somewhat heterogeneous group of disorders that have in common abnormalities in social functioning that begin during the developmental period, but that (unlike the pervasive developmental disorders) are not primarily characterized by an apparently constitutional social incapacity or deficit that pervades all areas of functioning. In many instances, serious environmental distortions or privations probably play a crucial role in etiology.

F94.0 Elective mutism
Characterized by a marked, emotionally determined selectivity in speaking, such that the child demonstrates a language competence in some situations but fails to speak in other (definable) situations. The disorder is usually associated with marked personality features involving social anxiety, withdrawal, sensitivity or resistance.

Selective mutism

Excl.: pervasive developmental disorders (F84.-) schizophrenia (F20.-) specific developmental disorders of speech and language (F80.-) transient mutism as part of separation anxiety in young children (F93.0)
F94.1 Reactive attachment disorder of childhood

Starts in the first five years of life and is characterized by persistent abnormalities in the child’s pattern of social relationships that are associated with emotional disturbance and are reactive to changes in environmental circumstances (e.g. fearfulness and hypervigilance, poor social interaction with peers, aggression towards self and others, misery, and growth failure in some cases). The syndrome probably occurs as a direct result of severe parental neglect, abuse or serious mishandling.

Use additional code, if desired, to identify any associated failure to thrive or growth retardation.

Excl.: Asperger syndrome (F84.5)
       disinhibited attachment disorder of childhood (F94.2)
       maltreatment syndromes (T74.-)
       normal variation in pattern of selective attachment
       sexual or physical abuse in childhood, resulting in psychosocial problems (Z61.4–Z61.6)

F94.2 Disinhibited attachment disorder of childhood

A particular pattern of abnormal social functioning that arises during the first five years of life and that tends to persist despite marked changes in environmental circumstances, e.g. diffuse, nonselectively focused attachment behaviour, attention-seeking and indiscriminately friendly behaviour, poorly modulated peer interactions; depending on circumstances, there may also be associated emotional or behavioural disturbance.

Affectionless psychopathy
Institutional syndrome

Excl.: Asperger syndrome (F84.5)
       hospitalism in children (F43.2)
       hyperkinetic disorders (F90.-)
       reactive attachment disorder of childhood (F94.1)

F94.8 Other childhood disorders of social functioning

F94.9 Childhood disorder of social functioning, unspecified

F95 Tic disorders

Syndromes in which the predominant manifestation is some form of tic. A tic is an involuntary, rapid, recurrent, nonrhythmic motor movement (usually involving circumscribed muscle groups) or vocal production that is of sudden onset and that serves no apparent purpose. Tics tend to be experienced as irresistible but usually they can be suppressed for varying periods of time, are exacerbated by stress, and disappear during sleep. Common simple motor tics include only eye- blinking, neck-jerking, shoulder-shrugging and facial grimacing. Common simple vocal tics include throat-clearing, barking, sniffing and hissing. Common complex tics include hitting oneself, jumping and hopping. Common complex vocal tics include the repetition of particular words, and sometimes the use of socially unacceptable (often obscene) words (coprolalia) and the repetition of one’s own sounds or words (palilalia).
CHAPTER V
MENTAL AND BEHAVIOURAL DISORDERS

F95.0 Transient tic disorder
Meets the general criteria for a tic disorder but the tics do not persist longer than 12 months. The tics usually take the form of eye-blinking, facial grimacing or head-jerking.

F95.1 Chronic motor or vocal tic disorder
Meets the general criteria for a tic disorder, in which there are motor or vocal tics (but not both), that may be either single or multiple (but usually multiple) and last for more than a year.

F95.2 Combined vocal and multiple motor tic disorder [Tourette]
A form of tic disorder in which there are, or have been, multiple motor tics and one or more vocal tics, although these need not have occurred concurrently. The disorder usually worsens during adolescence and tends to persist into adult life. The vocal tics are often multiple, with explosive repetitive vocalizations, throat-clearing and grunting, and there may be the use of obscene words or phrases. Sometimes there is associated gestural echopraxia, which may also be of an obscene nature (copropraxia).

F95.8 Other tic disorders
F95.9 Tic disorder, unspecified
Tic NOS

F98 Other behavioural and emotional disorders with onset usually occurring in childhood and adolescence
A heterogeneous group of disorders that share the characteristic of an onset in childhood but otherwise differ in many respects. Some of the conditions represent well-defined syndromes but others are no more than symptom complexes that need inclusion because of their frequency and association with psychosocial problems, and because they cannot be incorporated into other syndromes.

Excl.: breath-holding spells (R06.8)
        gender identity disorder of childhood (F64.2)
        Kleine–Levin syndrome (G47.8)
        obsessive-compulsive disorder (F42.-)
        sleep disorders due to emotional causes (F51.-)

F98.0 Nonorganic enuresis
A disorder characterized by involuntary voiding of urine, by day and by night, that is abnormal in relation to the individual’s mental age, and that is not a consequence of a lack of bladder control due to any neurological disorder, to epileptic attacks, or to any structural abnormality of the urinary tract. The enuresis may have been present from birth or it may have arisen following a period of acquired bladder control. The enuresis may or may not be associated with a more widespread emotional or behavioural disorder.

Enuresis (primary)(secondary) of nonorganic origin
Functional enuresis
Psychogenic enuresis
Urinary incontinence of nonorganic origin

Excl.: enuresis NOS (R32)
F98.1  **Nonorganic encopresis**
Repeted, voluntary or involuntary passage of faeces, usually of normal or near-normal consistency, in places not appropriate for that purpose in the individual’s own sociocultural setting. The condition may represent an abnormal continuation of normal infantile incontinence, it may involve a loss of continence following the acquisition of bowel control, or it may involve the deliberate deposition of faeces in inappropriate places in spite of normal physiological bowel control. The condition may occur as a monosymptomatic disorder, or it may form part of a wider disorder, especially an emotional disorder (F93.-) or a conduct disorder (F91.-).

Functional encopresis
Incontinence of faeces of nonorganic origin
Psychogenic encopresis
Use additional code, if desired, to identify the cause of any coexisting constipation.

*Excl.*: encopresis NOS (R15)

F98.2  **Feeding disorder of infancy and childhood**
A feeding disorder of varying manifestations, usually specific to infancy and early childhood. It generally involves food refusal and extreme faddiness in the presence of an adequate food supply, a reasonably competent caregiver, and the absence of organic disease. There may or may not be associated rumination (repeated regurgitation without nausea or gastrointestinal illness).

Rumination disorder of infancy

*Excl.*: anorexia nervosa and other eating disorders (F50.-)
feeding:
• difficulties and mismanagement (R63.3)
• problems of newborn (P92.-)
  pica of infancy or childhood (F98.3)

F98.3  **Pica of infancy and childhood**
Persistent eating of non-nutritive substances (such as soil, paint chippings, etc.). It may occur as one of many symptoms that are part of a more widespread psychiatric disorder (such as autism), or as a relatively isolated psychopathological behaviour; only the latter is classified here. The phenomenon is most common in mentally retarded children and, if mental retardation is also present, F70–F79 should be selected as the main diagnosis.
Stereotyped movement disorders

Voluntary, repetitive, stereotyped, nonfunctional (and often rhythmic) movements that do not form part of any recognized psychiatric or neurological condition. When such movements occur as symptoms of some other disorder, only the overall disorder should be recorded. The movements that are of a non-self-injurious variety include: body-rocking, head-rocking, hair-plucking, hair-twisting, finger-flicking mannerisms, and hand-flapping. Stereotyped self-injurious behaviour includes repetitive head-banging, face-slapping, eye-poking and biting of hands, lips or other body parts. All the stereotyped movement disorders occur most frequently in association with mental retardation (when this is the case, both should be recorded). If eye-poking occurs in a child with visual impairment, both should be coded: eye-poking under this category and the visual condition under the appropriate somatic disorder code.

thumb-sucking (F98.8)
tic disorders (F95.-)
trichotillomania (F63.3)

F98.5 Stuttering [stammering]

Speech that is characterized by frequent repetition or prolongation of sounds or syllables or words, or by frequent hesitations or pauses that disrupt the rhythmic flow of speech. It should be classified as a disorder only if its severity is such as to markedly disturb the fluency of speech.

*Excl.*: cluttering (F98.6)
tic disorders (F95.-)

F98.6 Cluttering

A rapid rate of speech with breakdown in fluency, but no repetitions or hesitations, of a severity to give rise to diminished speech intelligibility. Speech is erratic and dysrhythmic, with rapid jerky spurts that usually involve faulty phrasing patterns.

*Excl.*: stuttering (F98.5)

H54.9 Unspecified visual impairment (binocular)
Visual impairment category 9

For characterizing visual impairment for codes H54.0–H54.3, visual acuity should be measured with both eyes open, with presenting correction if any. For characterizing visual impairment for codes H54.4–H54.6, visual acuity should be measured monocularly with presenting correction if any.

If the extent of the visual field is taken into account, patients with a visual field of the better eye no greater than 10° in radius around central fixation should be placed under category 3. For monocular blindness (H54.4), this degree of field loss would apply to the affected eye.

Site of musculoskeletal involvement

The following subclassification to indicate the site of involvement is provided for optional use with appropriate categories in Chapter XIII. As local extensions or specialty adaptations may vary in the number of characters used, it is suggested that the supplementary site subclassification be placed in an identifiably separate position (e.g. in an additional box). Different subclassifications for use with derangement of knee, dorsopathies, and biomechanical lesions not elsewhere classified are given at M23, before M40 and at M99 respectively.

a) direct infection of joint, where organisms invade synovial tissue and microbial antigen is present in the joint;

b) indirect infection, which may be of two types: a reactive arthropathy, where microbial infection of the body is established but neither organisms nor antigens can be identified in the joint, and a postinfective arthropathy, where microbial antigen is present but recovery of an organism is inconstant and evidence of local multiplication is lacking.

CHAPTER XVIII

Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99)

This chapter includes symptoms, signs, abnormal results of clinical or other investigative procedures, and ill-defined conditions regarding which no diagnosis classifiable elsewhere is recorded.

Signs and symptoms that point rather definitely to a given diagnosis have been assigned to a category in other chapters of the classification. In general, categories in this chapter include the less well-defined conditions and symptoms that, without the necessary study of the case to establish a final diagnosis, point perhaps equally to two or more diseases or to two or more systems of the body. Practically all categories in the chapter could be designated ‘not otherwise specified’, ‘unknown etiology’ or ‘transient’. The Alphabetical index should be consulted to determine which symptoms and signs are to be allocated here and which to other chapters. The residual subcategories, numbered .8, are generally provided for other relevant symptoms that cannot be allocated elsewhere in the classification.

The conditions and signs or symptoms included in categories R00–R99 consist of:

a) cases for which no more specific diagnosis can be made even after all the facts bearing on the case have been investigated;

b) signs or symptoms existing at the time of initial encounter that proved to be transient and whose causes could not be determined;

c) provisional diagnoses in a patient who failed to return for further investigation or care;

d) cases referred elsewhere for investigation or treatment before the diagnosis was made;

e) cases in which a more precise diagnosis was not available for any other reason;

f) certain symptoms, for which supplementary information is provided, that represent important problems in medical care in their own right.

Excl.: abnormal findings on antenatal screening of mother (O28.-) certain conditions originating in the perinatal period (P00–P96)

This chapter contains the following blocks:

T80–T88 Complications of surgical and medical care, not elsewhere classified
T90–T98 Sequelae of injuries, of poisoning and of other consequences of external causes
The chapter uses the S-section for coding different types of injuries related to single body regions and the T-section to cover injuries to multiple or unspecified body regions, as well as poisoning and certain other consequences of external causes.

Where multiple sites of injury are specified in the titles, the word ‘with’ indicates involvement of both sites, and the word ‘and’ indicates involvement of either or both sites.

The principle of multiple coding of injuries should be followed wherever possible. Combination categories for multiple injuries are provided for use when there is insufficient detail as to the nature of the individual conditions, or for primary tabulation purposes when it is more convenient to record a single code; otherwise, the component injuries should be coded separately. Reference should also be made to the morbidity or mortality coding rules and guidelines in Volume 2.

The blocks of the S-section as well as T00–T14 and T90–T98 contain injuries at the three-character level classified by type as follows:

CHAPTER XX

External causes of morbidity and mortality (V01–Y98)

This chapter, which in previous revisions of the ICD constituted a supplementary classification, permits the classification of environmental events and circumstances as the cause of injury, poisoning and other adverse effects. Where a code from this section is applicable, it is intended that it will be used in addition to a code from another chapter of the classification indicating the nature of the condition. Most often, the condition will be classifiable to Chapter XIX, Injury, poisoning and certain other consequences of external causes (S00–T98). Causes of death should preferably be tabulated according to both Chapter XIX and Chapter XX, but if only one code is tabulated, then the code from Chapter XX should be used in preference. Other conditions that may be stated to be due to external causes are classified in Chapters I to XVIII. For these conditions, codes from Chapter XX should be used to provide additional information for multiple-condition analysis only.

Categories for sequelae of external causes of morbidity and mortality are included at Y85–Y89.

Transport accidents
(V01–V99)

Note: This section is structured in 12 groups. Those relating to land transport accidents (V01–V89) reflect the victim’s mode of transport and are subdivided to identify the victim’s ‘counterpart’ or the type of event. The vehicle of which the injured person is an occupant is identified in the first two characters, since it is seen as the most important factor to identify for prevention purposes.

Excl.: accidents to persons engaged in the maintenance or repair of transport equipment or vehicle (not in motion) unless injured by another vehicle in motion (W00–X59)
accidents involving vehicles, but unrelated to the hazards associated with the means of transportation, e.g., injuries received in a fight on board ship; transport vehicle involved in a cataclysm; finger crushed when shutting car door (W00–X59)
assault by crashing of motor vehicle (Y03)
event of undetermined intent (Y31–Y33)
intentional self-harm (X81–X83)

a) A transport accident (V01–V99) is any accident involving a device designed primarily for, or being used at the time primarily for, conveying persons or goods from one place to another.

b) A public highway [trafficway] or street is the entire width between property lines (or other boundary lines) of land open to the public as a matter of right or custom, for purposes of moving persons or property from one place to another. A roadway is that part of the public highway designed, improved and customarily used for vehicular traffic.

c) A traffic accident is any vehicle accident occurring on the public highway [i.e. originating on, terminating on, or involving a vehicle partially on the highway]. A vehicle accident is assumed to have occurred on the public highway unless another place is specified, except in the case of accidents involving only off-road motor vehicles, which are classified as nontraffic accidents unless the contrary is stated.
d) *A nontraffic accident* is any vehicle accident that occurs entirely in any place other than a public highway.

e) A pedestrian is any person involved in an accident who was not at the time of the accident riding in or on a motor vehicle, railway train, streetcar or animal-drawn or other vehicle, or on a pedal cycle or animal.

**Classification and coding instructions for transport accidents**

1. If an event is unspecified as to whether it was a traffic or a nontraffic accident, it is assumed to be:
   a) a traffic accident when the event is classifiable to categories V10–V82 and V87.
   b) a nontraffic accident when the event is classifiable to categories V83–V86. For these categories, the victim is either a pedestrian or an occupant of a vehicle designed primarily for off-road use.

2. When accidents involving more than one kind of transport are reported, the following order of precedence should be used:
   aircraft and spacecraft (V95–V97)
   watercraft (V90–V94)
   other modes of transport (V01–V89, V98–V99)
3. Where transport accident descriptions do not specify the victim as being a vehicle occupant and the victim is described as:

<table>
<thead>
<tr>
<th>transport accident description</th>
<th>classify the victim as a pedestrian (categories V01–V09).</th>
</tr>
</thead>
<tbody>
<tr>
<td>crushed</td>
<td></td>
</tr>
<tr>
<td>dragged</td>
<td></td>
</tr>
<tr>
<td>hit</td>
<td></td>
</tr>
<tr>
<td>injured</td>
<td></td>
</tr>
<tr>
<td>killed</td>
<td></td>
</tr>
<tr>
<td>knocked down</td>
<td></td>
</tr>
<tr>
<td>run over</td>
<td></td>
</tr>
</tbody>
</table>

4. Where transport accident descriptions do not indicate the victim’s role, such as:

<table>
<thead>
<tr>
<th>transport accident description</th>
<th>classify the victim as an occupant or rider of the vehicle mentioned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>aeroplane</td>
<td></td>
</tr>
<tr>
<td>bicycle</td>
<td></td>
</tr>
<tr>
<td>boat</td>
<td></td>
</tr>
<tr>
<td>bulldozer</td>
<td></td>
</tr>
<tr>
<td>bus</td>
<td></td>
</tr>
<tr>
<td>car</td>
<td></td>
</tr>
<tr>
<td>motorcycle</td>
<td></td>
</tr>
<tr>
<td>motorized tricycle</td>
<td></td>
</tr>
<tr>
<td>pick-up (truck)</td>
<td></td>
</tr>
<tr>
<td>recreational vehicle</td>
<td></td>
</tr>
<tr>
<td>spacecraft</td>
<td></td>
</tr>
<tr>
<td>streetcar</td>
<td></td>
</tr>
<tr>
<td>tractor</td>
<td></td>
</tr>
<tr>
<td>train</td>
<td></td>
</tr>
<tr>
<td>tram</td>
<td></td>
</tr>
<tr>
<td>truck</td>
<td></td>
</tr>
<tr>
<td>van</td>
<td></td>
</tr>
<tr>
<td>watercraft</td>
<td></td>
</tr>
</tbody>
</table>
If more than one vehicle is mentioned, do not make any assumption as to which vehicle was occupied by the victim unless the vehicles are the same. Instead, code to the appropriate categories V87–V88, V90–V94, V95–V97, taking into account the order of precedence given in note 2 above.

5. Where a transport accident, such as:
   vehicle (motor)(nonmotor):

     – burst tyre [blowout]
     – driver falling asleep
     – driver inattention
     – excessive speed
   failure of mechanical part
resulted in a subsequent collision, classify the accident as a collision. If an accident other than a collision resulted, classify it as a noncollision accident, according to the vehicle type involved.

6. Where a transport accident involving a vehicle in motion, such as:
   accidental poisoning from exhaust gas generated by
   breakage of any part of
   explosion of any part of
   fall, jump or being accidentally pushed from
   fire starting in
   hit by object thrown into or onto
   injured by being thrown against some part of, or object in
   injury from moving part of
   object falling in or on
resulted in a subsequent collision, classify the accident as a collision. If an accident other than a collision resulted, classify it as a noncollision accident, according to the vehicle type involved.
7. Land transport accidents described as:
collision (due to loss of control)(on highway) between vehicle and:
• abutment (bridge)(overpass)

Y96  Work-related condition
Y97  Environmental-pollution-related condition
Y98  Lifestyle-related condition
Factors influencing health status and contact with health services (Z00–Z99)

Note: This chapter should not be used for international comparison or for primary mortality coding.

Categories Z00–Z99 are provided for occasions when circumstances other than a disease, injury or external cause classifiable to categories A00–Y89 are recorded as ‘diagnoses’ or ‘problems’. This can arise in two main ways:

a) When a person who may or may not be sick encounters the health services for some specific purpose, such as to receive limited care or service for a current condition, to donate an organ or tissue, to receive prophylactic vaccination or to discuss a problem which is in itself not a disease or injury.

b) When some circumstance or problem is present which influences the person’s health status but is not in itself a current illness or injury. Such factors may be elicited during population surveys, when the person may or may not be currently sick, or be recorded as an additional factor to be borne in mind when the person is receiving care for some illness or injury.

This chapter contains the following blocks:

Z00–Z13 Persons encountering health services for examination and investigation
Z20–Z29 Persons with potential health hazards related to communicable diseases
Z30–Z39 Persons encountering health services in circumstances related to reproduction
Z40–Z54 Persons encountering health services for specific procedures and health care

Z62

Other problems related to upbringing

Z62.1 Parental overprotection

Pattern of upbringing resulting in infantilization and prevention of independent behaviour.

Z62.2 Institutional upbringing

Group foster care in which parenting responsibilities are largely taken over by some form of institution (such as residential nursery, orphanage, or children’s home), or therapeutic care over a prolonged period in which the child is in a hospital, convalescent home or the like, without at least one parent living with the child.

Z62.3 Hostility towards and scapegoating of child

Z62.5 Other problems related to neglect in upbringing

Lack of learning and play experience

Z62.6 Inappropriate parental pressure and other abnormal qualities of upbringing

Parents forcing the child to be different from the local norm, either sex-inappropriate (e.g. dressing a boy in girl’s clothes), age-inappropriate (e.g. forcing a child to take on responsibilities above her or his own age) or otherwise inappropriate (e.g. pressing the child to engage in unwanted or too difficult activities).

Note: These categories should never be used in primary coding. The codes are provided for use as supplementary or additional codes when it is desired to identify the resistance, non-responsiveness and refractive properties of a condition to antimicrobials and antineoplastic drugs.

U82 Resistance to beta-lactam antibiotics
Use additional code (B95–B98), if desired, to identify agents resistant to beta-lactam antibiotic treatment.

U82.0 Resistance to penicillin
Resistance to:
• Amoxicillin
• Ampicillin

U82.1 Resistance to methicillin

U82.2 Extended-spectrum beta-lactamase (ESBL) resistance
U82.8 Resistance to other beta-lactam antibiotics
U82.9 Resistance to beta-lactam antibiotics, unspecified

U83 Resistance to other antibiotics
Use additional code (B95–B98), if desired, to identify agents resistant to other antibiotic treatment.

Morphology of neoplasms
Morphology of neoplasms

The morphology of neoplasms is coded using the *International classification of diseases for oncology* (ICD-O). Its morphology list was formerly included in ICD-10, but became outdated soon, owing to the updates of ICD-O. As a result, it was decided to discontinue the inclusion of ICD-O codes in ICD-10 from 2016. Interested users can download the ICD-O lists from the classification website of WHO (www.who.int/classifications).

ICD-O is used mostly in tumour or cancer registries for coding the site (topography) and the histology (morphology) of neoplasms, usually obtained from a pathology report.

ICD-O is a multi-axial classification of the site, morphology, behaviour and grading of neoplasms.

The topography axis uses the ICD-10 classification of malignant neoplasms (except those categories that relate to secondary neoplasms and to specified morphological types of tumours) for all types of tumours, thereby providing greater site detail for non-malignant tumours than is provided in ICD-10. In contrast to ICD-10, ICD-O includes topography for sites of haematopoietic and reticuloendothelial tumours.

The morphology axis provides five-digit codes ranging from M-8000/0 to M-9989/3. The first four digits indicate the specific histological term. The fifth digit after the slash (/) is the behaviour code, which indicates whether a tumour is malignant, benign, in situ or uncertain (whether benign or malignant).

A separate one-digit code is also provided for histologic grading (differentiation).

The one-digit behaviour code is as follows:

/0  Benign
/1  Uncertain whether benign or malignant
    Borderline malignancy\(^1\)
    Low malignant potential\(^1\)
/2  Intraepithelial
    Noninfiltrating
    Noninvasive
/3  Malignant, primary site
/6  Malignant, metastatic site
    Malignant, secondary site
/9  Malignant, uncertain whether primary or metastatic site

\(^1\) Except cystadenomas of ovary in M844–M849, which are considered to be malignant.
In ICD-O, the morphology code numbers include the behaviour code appropriate to the histological type of neoplasm.

The following table shows the correspondence between the behaviour code and the different sections of Chapter II:

<table>
<thead>
<tr>
<th>Behaviour code</th>
<th>Chapter II categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>/0</td>
<td>Benign neoplasms</td>
</tr>
<tr>
<td>/1</td>
<td>Neoplasms of uncertain and unknown behaviour</td>
</tr>
<tr>
<td>/2</td>
<td>In situ neoplasms</td>
</tr>
<tr>
<td>/3</td>
<td>Malignant neoplasms, stated or presumed to be primary</td>
</tr>
<tr>
<td>/6</td>
<td>Malignant neoplasms, stated or presumed to be secondary</td>
</tr>
</tbody>
</table>

The ICD-O behaviour digit /9 is not applicable in the ICD context, since all malignant neoplasms are presumed to be primary (/3) or secondary (/6), according to other information on the medical record.

Only the first-listed term of the full ICD-O morphology nomenclature appears against each code number in the list given here.

Some types of neoplasm are specific to certain sites or types of tissue. For example, nephroblastoma, by definition, always arises in the kidney; hepatocellular carcinoma is always primary in the liver; and basal cell carcinoma usually arises in the skin. For such terms, the appropriate site code has been added in parentheses in ICD-O. The appropriate fourth character for the reported site should be used. The ICD-O site codes assigned to the morphologic terms can be used when the site of the neoplasm is not given in the diagnosis. In ICD-O, site codes have not been assigned to many of the morphology terms because the histologic types can arise in more than one organ or type of tissue.

For further detail about the coding of morphology refer to ICD-O.

**Coded nomenclature for morphology of neoplasms**

This is no longer supported in ICD-10 since 2016.

Currently, ICD-10 still mentions ICD-O codes in its three volumes. These codes need to be verified against the most recent version of ICD-O.

Definitions
Definitions

Note: These definitions have been adopted by the World Health Assembly (resolutions WHA20.19 and WHA43.24) under Article 23 of the Constitution of the World Health Organization.

1. Causes of death
The causes of death to be entered on the medical certificate of cause of death are all those diseases, morbid conditions or injuries that either resulted in or contributed to death and the circumstances of the accident or violence that resulted in any such injuries.

2. Underlying cause of death
The underlying cause of death is (a) the disease or injury which initiated the train of events leading directly to death, or (b) the circumstances of the accident or violence which produced the fatal injury.

3. Definitions in relation to fetal, perinatal, neonatal and infant mortality

3.1. Live birth
Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered liveborn.

3.2. Fetal death [deadborn fetus]
Fetal death is death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

3.3. Birth weight
The first weight of the fetus or neonate obtained after birth.

3.4. Low birth weight
Less than 2500 g (up to, and including, 2499 g)
3.5. **Very low birth weight**
Less than 1500 g (up to, and including 1499 g).

3.6. **Extremely low birth weight**
Less than 1000 g (up to, and including, 999 g)

3.7. **Gestational age**
The duration of gestation is measured from the first day of the last normal menstrual period. Gestational age is expressed in completed days or completed weeks (e.g. events occurring 280 to 286 completed days after the onset of the last normal menstrual period are considered to have occurred at 40 weeks of gestation).

3.8. **Pre-term**
Less than 37 completed weeks (less than 259 days) of gestation

3.9. **Term**
From 37 completed weeks to less than 42 completed weeks (259 to 293 days) of gestation

3.10. **Post-term**
42 completed weeks or more (294 days or more) of gestation

3.11. **Perinatal period**
The perinatal period commences at 22 completed weeks (154 days) of gestation (the time when birth weight is normally 500 g), and ends seven completed days after birth.

3.12. **Neonatal period**
The neonatal period commences at birth and ends 28 completed days after birth. Neonatal deaths (deaths among live births during the first 28 completed days of life) may be subdivided into *early neonatal deaths*, occurring during the first seven days of life, and *late neonatal deaths*, occurring after the seventh day but before 28 completed days of life.
Notes on definitions

i. For live births, birth weight should preferably be measured within the first hour of life before significant postnatal weight loss has occurred. While statistical tabulations include 500g groupings for birth weight, weights should not be recorded in those groupings. The actual weight should be recorded to the degree of accuracy to which it is measured.

ii. The definitions of ‘low’, ‘very low’, and ‘extremely low’ birth weight do not constitute mutually exclusive categories. Below the set limits, they are all-inclusive and therefore overlap (i.e. ‘low’ includes ‘very low’ and ‘extremely low’, while ‘very low’ includes ‘extremely low’).

iii. Gestational age is frequently a source of confusion when calculations are based on menstrual dates. For the purposes of calculation of gestational age from the date of the first day of the last normal menstrual period and the date of delivery, it should be borne in mind that the first day is day 0 and not day 1; days 0–6 therefore correspond to ‘completed week 0’, days 7–13 to ‘completed week 1’, and the 40th week of actual gestation is synonymous with ‘completed week 39’. Where the date of the last normal menstrual period is not available, gestational age should be based on the best clinical estimate. In order to avoid misunderstanding, tabulations should indicate both weeks and days.

iv. Age at death during the first day of life (day 0) should be recorded in units of completed minutes or hours of life. For the second (day 1), third (day 2) and through 27 completed days of life, age at death should be recorded in days.

4. Definitions related to maternal mortality

4.1. Maternal death
A maternal death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not from accidental or incidental causes.

4.2. Late maternal death
A late maternal death is the death of a woman from direct or indirect obstetric causes more than 42 days but less than one year after termination of pregnancy.

4.3. Pregnancy-related death (death occurring during pregnancy, childbirth and puerperium)
A pregnancy-related death is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the cause of death.
Maternal deaths should be subdivided into two groups:

4.4. **Direct obstetric deaths**
Direct obstetric deaths are those resulting from obstetric complications of the pregnant state (pregnancy, labour and puerperium), from interventions, omissions or incorrect treatment, or from a chain of events resulting from any of the above.

4.5. **Indirect obstetric deaths**
Indirect obstetric deaths are those resulting from previous existing disease or disease that developed during pregnancy and that was not due to direct obstetric causes, but which was aggravated by physiologic effects of pregnancy.
Regulations regarding nomenclature
Regulations regarding nomenclature

(including the compilation and publication of statistics) with respect to diseases and causes of death

The Twentieth World Health Assembly,
Considering the importance of compiling and publishing statistics of mortality and morbidity in comparable form;
Having regard to Articles 2(s), 21(b), 22 and 64 of the Constitution of the World Health Organization,
ADOPTS, this twenty-second day of May 1967, the Nomenclature Regulations 1967; these Regulations may be cited as the WHO Nomenclature Regulations.

Article 1
Members of the World Health Organization for whom these Regulations shall come into force under Article 7 below shall be referred to hereinafter as Members.

Article 2
Members compiling mortality and morbidity statistics shall do so in accordance with the current revision of the International Statistical Classification of Diseases, Injuries and Causes of Death as adopted from time to time by the World Health Assembly. This Classification may be cited as the International Classification of Diseases.

Article 3
In compiling and publishing mortality and morbidity statistics, Members shall comply as far as possible with recommendations made by the World Health Assembly as to classification, coding procedure, age-grouping, territorial areas to be identified, and other relevant definitions and standards.

Article 4
Members shall compile and publish annually for each calendar year statistics of causes of death for the metropolitan (home) territory as a whole or for such part thereof as information is available, and shall indicate the area covered by the statistics.
INTERNATIONAL CLASSIFICATION OF DISEASES

Article 5
Members shall adopt a form of medical certificate of cause of death that provides for the statement of the morbid conditions or injuries resulting in or contributing to death, with a clear indication of the underlying cause.

Article 6
Each member shall, under Article 64 of the Constitution, provide the Organization on request with statistics prepared in accordance with these Regulations and not communicated under Article 63 of the Constitution.

Article 7
1. These Regulations shall come into force on the first day of January 1968.
2. Upon their entry into force these Regulations shall, subject to the exceptions hereinafter provided, replace as between the Members bound by these Regulations and as between these Members and the Organization, the provisions of the Nomenclature Regulations 1948 and subsequent revisions thereof.
3. Any revisions of the International Classification of Diseases adopted by the World Health Assembly pursuant to Article 2 of these Regulations shall enter into force on such date as is prescribed by the World Health Assembly and shall, subject to the exceptions hereinafter provided, replace any earlier classifications.

Article 8
1. The period provided in execution of Article 22 of the Constitution of the Organization for rejection or reservation shall be six months from the date of the notification by the Director-General of the adoption of these Regulations by the World Health Assembly. Any rejection or reservation received by the Director-General after the expiry of this period shall have no effect.
2. The provisions of paragraph 1 of this Article shall likewise apply in respect of any subsequent revision of the International Classification of Diseases adopted by the World Health Assembly pursuant to Article 2 of these Regulations.

Article 9
A rejection, or the whole or part of any reservation, whether to these Regulations or to the International Classification of Diseases or any revision thereof, may at any time be withdrawn by notifying the Director-General.
Article 10
The Director-General shall notify all Members of the adoption of these Regulations, of the adoption of any revision of the International Classification of Diseases as well as of any notification received by him under Articles 8 and 9.

Article 11
The original texts of these Regulations shall be deposited in the Archives of the Organization. Certified true copies shall be sent by the Director-General to all Members. Upon the entry into force of these Regulations, certified true copies shall be delivered by the Director-General to the Secretary-General of the United Nations for registration in accordance with Article 102 of the Charter of the United Nations.

In faith whereof, we have set our hands at Geneva this twenty-second day of May 1967.
