Update on the Dengue situation in the Western Pacific Region

Northern Hemisphere

Cambodia
As of epidemiological week 24, 2021, a total of 751 dengue cases, including one death, have been reported in Cambodia for 2021. This cumulative number of cases represents approximately a four-fold decrease as compared to the number of cases reported during the same period in 2020 (n=2,906). The number of cases reported weekly remains lower than the normal range of cases reported from 2015 to 2020 (Figure 1). The reported number of dengue cases is lower in all provinces compared to trends observed in 2020.

China
In May 2021, five dengue cases and no deaths were reported in China. The trend in 2021 follows an expected seasonal trend (Figure 2).

Lao People’s Democratic Republic
During epidemiological week 24 of 2021, 24 dengue cases and no deaths were reported in Lao People’s Democratic Republic (Figure 3). The number of cases reported as of epidemiological week 24 2021 is 374; this is almost 4.4 times lower compared to the same period in 2020 when 1,650 cases were reported. The trend is within seasonally expected levels.

Malaysia
During epidemiological week 25, 2021, a total of 642 dengue cases and no deaths were reported. As of 26 June 2021, the cumulative number of reported cases is 13,496. This is a significant decrease compared to 52,271 cases reported during the same period in 2020. As of epidemiological week 25, a total of nine deaths due to dengue have been reported in 2021, compared to 90 deaths during the same period in 2020.
Philippines (no update)
In epidemiological week 15, from 11 to 17 April 2021, a total of one hundred twenty-two (122) dengue cases have been reported with no mortalities. This is 76% lower compared to the same period in 2020 (n=516). From 1 January to 17 April 2021, there has been a total of 21,478 dengue cases with 80 deaths (CFR 0.4%) reported, this is 56% lower compared to the 49,135 cases reported in the same period in 2020.

Singapore
In epidemiological week 24 of 2021, 136 dengue cases were reported in Singapore and a total of 3,148 cases have been reported since epidemiological week 1 of 2021 (Figure 6). Weekly trends are within expected seasonal levels.

Viet Nam (no update)
During week 21 of 2021, there were 1,153 cases and no deaths reported from 37 out of 63 provinces. The number of cases decreased by 16% compared to the previous week (1,373 cases, no deaths). As of 30 May 2021, a total of 28,077 cases of dengue, including five deaths, have been reported in Viet Nam. Compared to the same period in 2020 (29,482 cases including three deaths), the cumulative number of cases decreased by 4.8%, with two more deaths reported.

Southern Hemisphere
Australia
As of 30 June 2021, one cumulative case of dengue has been reported in Australia to-date (Figure 8). In contrast, there were 220 dengue cases reported in Australia in January to June 2020 indicating a marked reduction in the number of cases. The significant drop in dengue cases for 2021 in Australia as compared to previous years during the same time period may be attributed to COVID-19 related travel restrictions. Prior to COVID-19, Australia had seen increasing notifications in overseas-acquired cases from returning travellers to dengue endemic areas.
Pacific Islands Countries

Cook Islands (no update)
Between 1 January and 25 May 2021, a total of 200 dengue cases with no deaths were reported in the Cook Islands where a dengue type-2 (DENV-2) outbreak has been ongoing since February 2021 (Figure 9). Among the reported cases, there are 153 probable cases positive by NS1 antigen (NS1 Ag+) and 47 cases confirmed to have DENV-2 infection based on PCR testing.

French Polynesia
During epidemiological weeks 21 and 22 of 2021, of 52 suspected dengue cases tested for dengue-specific IgM (Figure 10) none tested positive. In 2021, the proportion of dengue-like illness (DLI) cases among consultations at sentinel sites has remained below 2%.
New Caledonia
During epidemiological weeks 1 to 24 of 2021, a total of 112 dengue cases were reported in New Caledonia, including 91 confirmed cases, 20 probable cases, and one suspected case (Figure 11). This is an increase compared to the same period in 2020 when a total of 50 cases were reported. DENV-2 was detected in 83 out of the 90 confirmed cases as of 29 June 2021.

Wallis and Futuna (no update)
During epidemiological weeks 8 to 13 of 2021, 26 confirmed cases of dengue were reported in Wallis and Futuna (Figure 12). All are local cases with 23 cases reported in Futuna and three cases reported in Wallis. In 2020, there were 124 cases (confirmed and probable).
Pacific Island Countries and Areas (PICs) – Dengue-like illness (DLI) Surveillance

In the Pacific Island Countries and Areas, during epidemiological week 24 of 2021, there was an increase in DLI cases reported in the Solomon Islands and the Cook Islands. Meanwhile, the number of DLI cases reported in Fiji has continued to decrease (Figure 13). Other Pacific Island Countries and Areas with available surveillance data are reporting no or very low numbers of DLI cases.

* Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
