Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 35 of 2021 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 37, 2020 to week 35, 2021 have been Influenza B (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity continues to be lower than in previous seasons.

Outpatient ILI Surveillance

China (North)

During week 34 of 2021, the percentage of visits for ILI at national sentinel hospitals in Northern China was 1.7%, lower than last week (2.0%), lower than the same period in 2018-2019 (2.1%, and 2.0%, respectively), and the same during week 34 of 2020 (1.7%) (Figure 2).
Mongolia
During week 33 of 2021, there was a slight decrease in ILI activity in Mongolia from the previous week, with four ILI cases per 10,000 population as compared to 13 for week 32. This is higher than the lower tolerance limit of one ILI cases per 10,000 population, yet lower than the upper tolerance limit of 20 per 10,000 population for this week (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2019-2021](Source: Mongolia National Influenza Center)

Republic of Korea
In week 35 of 2021, the overall weekly ILI rate was 0.9 ILI cases per 1,000 outpatient visits, which was slightly lower than the previous week (1.1 ILI cases per 1,000 outpatient visits). The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) since week 10 of 2020 (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2021](Source: Korean Centres for Disease Control and Prevention)
Sentinel influenza surveillance

**Japan**
In week 33 of 2021, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases this year has not been in line with usual trends in which seasonal peaks are seen between weeks 1-9, the trend in 2021 has been consistently low with no peak (Figure 5).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2011-2021](image)
(Source: Japan National Institute of Infectious Diseases)

**Countries/areas in the tropical zone**
ILI and influenza activity continued to be lower than previous seasons in most of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**
In week 35 of 2021, the average consultation rate for ILI among sentinel general outpatient clinics was 0.3 ILI cases per 1,000 consultations, which was lower than 0.8 ILI cases per 1,000 consultations recorded in the previous week and slightly less than the rate of consultation during the same period in 2020 (Figure 6). The average consultation rate for ILI among sentinel private medical practitioners was 10.5 ILI cases per 1,000 consultations, which was lower than 6.9 recorded in the previous week and the lowest ILI rate recorded during the same period from 2017 to current (Figure 7).
China (South) - ILI Surveillance

During week 34 of 2021, the percentage of visits for ILI at national sentinel hospitals in Southern China was 2.6%, lower than the previous week (2.8%) and lower than the same period in 2018-2020 (2.7%, 2.9%, and 2.7%, respectively) (Figure 8).

(Source: China National Influenza Center)
Singapore – Acute Respiratory Infection (ARI) Surveillance

In week 34 of 2021, the average daily number of patients seeking treatment in polyclinics for ARI was 1082 over 5.5 working days, higher than the previous season in 2020 (Figure 9). Of 136 samples tested for influenza in the past 4 weeks, the positivity rate in the community was 0.0%. The last specimen to test positive for influenza was collected in July 2021 and tested positive for influenza B (Figure 10).

![Figure 10: Monthly influenza surveillance for ARI in Singapore, 2020-2021](Image)

(Source: Singapore Ministry of Health)
Lao PDR
From 14 to 20 August 2021, the proportion of ILI cases presenting to sentinel sites has slightly decreased compared to the previous week. Since week 18, ILI presentations have been lower compared to the 3-year average (Figure 11).

![Figure 11: Weekly proportion of ILI presentations at sentinel sites for 2021 compared to previous 3-year average (2018 to 2020)](image)
(Source: Lao National Center for Laboratory and Epidemiology)

Cambodia
In week 33 of 2021, the number of ILI cases reported weekly by sentinel outpatient sites remained low in Cambodia. The number of cases has remained relatively stable after a peak in positivity rate seen in week 40, 2020 (65.2%) (Figure 12). In week 33, 2021, there were no positive specimens for influenza A or B; there has only been one avian influenza A(H9N2) case detected for 2021 in week 8 (Figure 13).

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

From 16 August to 29 August 2021, there were 21 laboratory-confirmed influenza notification to the National Notifiable Disease Surveillance System (NNDSS). In the year to date, there have been 483 notifications of laboratory-confirmed influenza to the NNDSS. Number of confirmed cases reported have remained low since April 2020 and are lower than the five-year average (Figure 14).

New Zealand – Influenza like Illness

Overall, based on multiple sources of surveillance information, influenza-like illness (ILI) activity has remained low in the week ending 29 August 2021. Community ILI activity remains very low for this time of year. The rates of Healthstat consultations for ILI mirror the levels seen at the same time in 2020. The ILI consultation rates in all age groups in the week ending 29 August are below the historical rates (Figure 15). Public Health Units routinely investigate respiratory outbreaks, including laboratory testing of a sample of cases. There are currently five influenza cases detected through the surveillance system in 2021.

(Source: New Zealand Institute of Environmental Science and Research)
Pacific Island Countries and Areas (PICs) - ILI Surveillance

In the Pacific Island Countries and Areas, in week 34 of 2021, slight increases were seen in the Commonwealth of the Northern Mariana Islands and Wallis & Futuna. The sharp increase in the number of ILI cases seen in the Federated States of Micronesia as well as in Fiji are most likely attributed to the increased number of sites reporting in week 34 as compared to the previous week. A reduction of ILI cases was notably seen in the Republic of the Marshall Islands (Figure 16).

* Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
