Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 15 of 2022 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 1 to week 15 2022 have been Influenza B (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of \( \geq 38^\circ C \) and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of \( \geq 38^\circ C \) and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

**China (North)**

During week 14 of 2022, the percentage of visits for ILI at national sentinel hospitals in Northern China was 2.2%, higher than the last week (2.0%), lower than the same week of 2019 (4.0%), higher than the same week of 2020 and 2021 (2.0% and 2.2%). (**Figure 2**).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in Northern China, 2018-2022](Source: China National Influenza Center)
Mongolia
During week 13 of 2022, the ILI activity in Mongolia decreased to 71 ILI cases per 10,000 population. This is higher than the upper tolerance limit of 39 ILI cases per 10,000 population (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2022](Source: Mongolia National Influenza Center)

Republic of Korea
In week 15 of 2022, the overall weekly ILI rate was 3.2 ILI cases per 1,000 outpatient visits, which was slightly lower compared to the previous week (3.9). The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) and absence of seasonal peaks since week 10 of 2020 (Figure 4). Between 3 April 2022 and 9 April 2022, of 67 samples collected from patients with Acute Respiratory Infection at sentinel surveillance sites, 10.4% and 3.0% tested positive for rhinovirus and coronavirus, respectively.

Sentinel influenza surveillance

Japan

In week 13 of 2022, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases in 2022 has been consistently low (Figure 5).

Countries/areas in the tropical zone

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 15 of 2022, the average consultation rate for ILI at sentinel general outpatient clinics was 0.2 ILI cases per 1,000 consultations, which was the same as 0.2 reported in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner clinics was 12.7 ILI cases per 1,000 consultations, which was higher than 9.8 recorded in the previous week (Figure 7).
China (South) - ILI Surveillance
During week 14 of 2022, the percentage of visits for ILI at national sentinel hospitals in Southern China was 3.7%, higher than the last week (3.5%), lower than the same week of 2019 (4.3%), higher than the same week of 2020 and 2021 (2.2% and 3.0%) (Figure 8).

Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 14 of 2022, the average daily number of patients seeking treatment in polyclinics for ARI was 1,469, higher than the previous season in 2021 (Figure 9). Of 192 samples tested for influenza in the past 4 weeks, the positivity rate in the community was 1.0%. Of the ten specimens tested positive for influenza in March 2022, all were positive for influenza A(H3N2). (Figure 10).
Influenza Situation Update

Lao PDR
During week 13 of 2022, 218 ILI cases presented to sentinel sites, which was 19 cases lower than the previous week. Of 109 samples tested for influenza in week 13, 2022, zero (0) cases tested positive (Figure 11).

Cambodia
In week 14 of 2022, Ministry of Health received data from six sentinel sites in Cambodia. The number of ILI cases low in Cambodia until week 32 of 2021, and slightly increase from week 8 to 14 of 2022 In 2021, there was one human infection with avian influenza A(H9N2) detected in week 8 of 2021. There have been no positive case in 2022 (Figure 12).
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza (no update)**

From 25 October to 7 November 2021, there were 14 laboratory-confirmed influenza notifications to the National Notifiable Disease Surveillance System (NNDSS). In the year to date, there have been 598 notifications of laboratory-confirmed influenza to the NNDSS. The number of confirmed cases reported has remained low since April 2020 and is lower than the five-year average (Figure 13).

New Zealand – Influenza like Illness
Overall, based on multiple sources of surveillance information, influenza-like illness (ILI) activity has remained high in the week ending 8 April 2022. Community ILI activity remains very high for this time of year, driven by the current COVID-19 Omicron outbreak. The rates of Healthstat consultations for ILI are lower than the levels seen at the same time in 2020. The ILI consultation rates in most age groups in the week ending 8 April are below the historical rates (Figure 14). Public Health Units routinely investigate respiratory outbreaks, including laboratory testing of a sample of cases. There are currently five influenza cases detected through the surveillance system in 2021 (source).

Figure 14: Weekly rates of general practice ILI consultations per 100,000 people in New Zealand in 2020-2021 (Source: New Zealand Institute of Environmental Science and Research)

Pacific Island Countries and Areas (PICs) - ILI Surveillance
In week 14, 2022, low levels of influenza-like illness activity continue to be reported across the Pacific Island Countries and Areas (Figure 15).
Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
