Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 23 of 2022 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 1 to week 23 2022 have been Influenza A (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)

During week 22 of 2022, the percentage of visits for ILI at national sentinel hospitals in Northern China was 1.7%, the same as the previous week (1.7%), lower than the same week of 2019 to 2021 (2.4%, 1.9% and 3.0%). (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in Northern China, 2019-2022](Source: China National Influenza Center)
Mongolia
During week 21 of 2022, the ILI activity in Mongolia decreased to 46 ILI cases per 10,000 population. This is higher than the upper tolerance limit of 25 ILI cases per 10,000 population (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2022](Source: Mongolia National Influenza Center)

Republic of Korea
In week 23 of 2022, the overall weekly ILI rate was 1.8 ILI cases per 1,000 outpatient visits, which was lower than previous week (2.1). The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) and absence of seasonal peaks since week 10 of 2020 (Figure 4). In week 23 of 2022, of the 117 samples collected, all were negative for influenza virus.

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2022](Source: Korean Centres for Disease Control and Prevention)
Sentinel influenza surveillance

Japan
In week 21 of 2022, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases in 2022 has been consistently low (Figure 5).

Countries/areas in the tropical zone
ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

Hong Kong SAR (China) – ILI and hospital Surveillance
In week 23 of 2022, the average consultation rate for ILI at sentinel general outpatient clinics was 0.4 ILI cases per 1,000 consultations, which was higher than 0.3 reported in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner clinics was 6.8 ILI cases per 1,000 consultations, which was lower than 7.5 recorded in the previous week (Figure 7).

China (South) - ILI Surveillance
During week 22 of 2022, the percentage of visits for ILI at national sentinel hospitals in Southern China was 5.1%, higher than the last week (4.0%), higher than the same week of 2019-2021 (4.1%, 2.9% and 4.3%). (Figure 8).

(Source: China National Influenza Center)

Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 22 of 2022, the average daily number of patients seeking treatment in polyclinics for ARI was 1,650, higher than the previous season in 2021 (Figure 9). Of 648 samples tested for influenza in the past 4 weeks, the positivity rate in the community was 0.8%. Of the specimens tested positive for influenza in May 2022, it was positive for influenza A(H3N2) / influenza B. (Figure 10).

(Source: Singapore Ministry of Health)

Figure 10: Monthly influenza surveillance for ARI in Singapore, 2020-2022
(Source: Singapore Ministry of Health)
Lao PDR
During week 22 of 2022, the ILI cases presented to sentinel sites was 52 cases higher than the previous week. Of 52 samples tested for influenza in week 22, 2022, all were tested negative for Influenza (Figure 11).

Cambodia
In week 21 of 2022, Ministry of Health received data from seven sentinel sites in Cambodia. The percentage of ILI cases was 2.1%, which is lower compared to previous week (week 20 of 2022, 2.3%), and lower than the same week of 2021 (week 21 of 2021, 5.1%). Since week 35 of 2020, there was one human infection with avian influenza A(H9N2) detected in week 8 of 2021. There have been no positive case in 2022 (Figure 12).
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

From 23 May to 06 June 2022, there were 47,860 laboratory-confirmed influenza notifications to the National Notifiable Disease Surveillance System (NNDSS). This is higher than the number of notifications with a diagnosis date in the previous fortnight. In the year to date, there have been 87,989 notifications of laboratory-confirmed influenza to the NNDSS. The number of notifications in 2022 have increased since March, and is currently higher than the weekly 5 year average for this time of year *(Figure 13)*.

![Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2017 to 2022 in Australia (Source: National Notifiable Diseases Surveillance System, Australian Department of Health)](image)

**New Zealand – Influenza like Illness**

Overall, based on multiple sources of surveillance information, community ILI activity has increased in the week ending 3 June *(Figure 14)*. Activity remains high for this time of year. While this may be largely driven by the current COVID-19 Omicron outbreak, there is now also evidence of non-COVID-19 ILI activity throughout New Zealand.

Influenza Situation Update

Pacific Island Countries and Areas (PICs) - ILI Surveillance

In week 22, 2022, low levels of influenza-like illness activity continue to be reported across the Pacific Island Countries and Areas (Figure 15).
