Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 29 of 2022 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 1 to week 29 2022 have been Influenza A (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)

During week 28 of 2022, the percentage of visits for ILI at national sentinel hospitals in Northern China was 2.0%, higher than the last week (1.9%), lower than the same week of 2019 and 2021 (2.3% and 2.4%). (Figure 2).

Figure 2: Percentage of visits for ILI at sentinel hospitals in Northern China, 2019-2022
(Source: China National Influenza Center)
**Mongolia**
During week 27 of 2022, the ILI activity in Mongolia decreased to 9 ILI cases per 10,000 population. This is lower than the upper tolerance limit of 19 ILI cases per 10,000 population (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2022](Source: Mongolia National Influenza Center)

**Republic of Korea**
In week 29 of 2022, the overall weekly ILI rate was 3.4 ILI cases per 1,000 outpatient visits, which was higher than previous week (2.9). The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) and absence of seasonal peaks since week 10 of 2020 (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2022](Source: Korean Centre for Disease Control and Prevention)
Sentinel influenza surveillance

**Japan**
In week 27 of 2022, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases in 2022 has been consistently low (**Figure 5**).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2012-2022](Source: Japan National Institute of Infectious Diseases)

Countries/areas in the tropical zone
ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**
In week 29 of 2022, the average consultation rate for ILI at sentinel general outpatient clinics (GOPC) was 0.6 ILI cases per 1,000 consultations, which was higher than 0.4 reported in the previous week (**Figure 6**). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 10.6 ILI cases per 1,000 consultations, which was higher than 9.7 recorded in the previous week (**Figure 7**).

![Figure 7: ILI consultation rates at sentinel private doctors, Hong Kong SAR 2018-2022](Source: Hong Kong Centre for Health Protection)
China (South) - ILI Surveillance

During week 28 of 2022, the percentage of visits for ILI at national sentinel hospitals in Southern China was 5.0%, lower than the last week (5.5%), higher than the same week of 2019-2021 (3.7%, 2.7% and 3.5%). (Figure 8).

Singapore – Acute Respiratory Infection (ARI) Surveillance

In week 28 of 2022, the average daily number of patients seeking treatment in polyclinics for ARI was 3217, higher than the previous season in 2021 (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.6. Of 851 samples tested for influenza in the past 4 weeks, the positivity rate in the community was 6.0%. Of the 28 specimens tested positive for influenza in June 2022, they were positive for Influenza A(H3N2) (96.0%) and Influenza A(pH1N1) (4.0%) (Figure 10).

![Figure 10: Monthly influenza surveillance for ARI in Singapore, 2020-2022](Source: Singapore Ministry of Health)
**Lao PDR**

During week 28 of 2022, 70 more ILI cases presented to sentinel sites compared to the previous week. Of 47 samples tested for influenza in week 28, 2022, no case was tested positive for influenza (Figure 11).

![Figure 11: Weekly number of ILI cases at sentinel sites (2018 to 2022)](source)

(Source: Lao National Center for Laboratory and Epidemiology)

**Cambodia**

In week 28 of 2022, Ministry of Health received data from seven sentinel sites in Cambodia. The trend in 2022 showed an increase from week 8 that peaked in week 16 of 2022. However, during the last two weeks (week 27 and 28 of 2022) was an increased in ILI cases compare to the previous week (week 26 of 2022). The positivity rate increase where there were two positive cases in 2022 in week 25 and 28 (Figure 12).

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

For the reporting period 4 July to 17 July 2022, Australia reported 204,911 laboratory-confirmed cases of influenza for the year to date in 2022. There were 16,707 laboratory-confirmed influenza notifications with a diagnosis date this fortnight. From mid-April 2022, the weekly number of notifications of laboratory-confirmed influenza reported in Australia has exceeded the 5 year average (Figure 13).

**Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2017 to 2022 in Australia**

(Source: National Notifiable Diseases Surveillance System, Australian Department of Health)

**New Zealand – Influenza like Illness**

Overall, based on multiple sources of surveillance information, community ILI activity remains elevated in the week ending 15 July (Figure 14). Activity is higher than historical rates for this time of year. ILI rates for those aged under 5 years are below the rate seen at the same time last year, when an RSV outbreak was ongoing.

Pacific Island Countries and Areas (PICs) - ILI Surveillance
In week 28, 2022, low levels of influenza-like illness activity continue to be reported across the Pacific Island Countries and Areas except Kiribati, Palau, Pitcairn Islands and Samoa (Figure 15).
