Update on the Dengue situation in the Western Pacific Region

Northern Hemisphere

Cambodia (no update)
From epidemiological weeks 52 in 2021, a total of 1,903 dengue cases, including eight deaths (case fatality rate (CRF) 0.4%), have been reported in Cambodia for 2021. The number of cases reported weekly remains lower than the normal range of cases reported from 2015 to 2020 (Figure 1). The reported number of dengue cases is lower in all provinces compared to trends observed in 2020.

China
In January 2022, 3 dengue cases and no deaths were reported in China. The trend in 2021 is below usual seasonal trend, as compared to previous years (Figure 2).

Source: National Health Commission, China
Lao People’s Democratic Republic (no update)
During epidemiological week from 49 to 50 of 2021, 18 dengue cases and no deaths were reported in Lao People’s Democratic Republic (Figure 3). The cumulative number of cases reported as of epidemiological week 50 2021 is 1,346. This is lower compared to 7,618 cases reported during the same period in 2020.

Malaysia (no update)
During epidemiological week 52 of 2021, a total of 571 dengue cases have been reported. As of 3 January 2022, the cumulative number of reported cases is 26,365. This is a significant decrease of 70.8% compared to 90,304 cases reported during the same period in 2020. As of epidemiological week 52 of 2021, a total of 20 deaths due to dengue have been reported in 2021, compared to 145 deaths during the same period in 2020.

Philippines
In epidemiological week 52, from 26 to 31 December 2021, there was a total of 209 dengue cases and no death reported. This is 79% lower compared to the same period in 2020 (n=973). From 1 January to 31 December 2021, there has been a total of 79,872 dengue cases with 285 deaths (CFR 0.4%) reported, this is 12% lower compared to the 90,135 cases reported in the same period in 2020.
Singapore (no update)
In epidemiological week 52 of 2021, 76 dengue cases were reported in Singapore and a total of 5,245 cases have been reported since epidemiological week 1 of 2021 (Figure 6). Weekly trends are within expected seasonal levels.

Viet Nam
In epidemiological week 2 of 2022, there were 911 cases and no deaths reported from 37 out of 63 provinces in Viet Nam. The number of cases decreased by 9.1% compared to the previous week (1,002 cases including no deaths). As of 16 January 2022, a total of 2,240 cases of dengue, including one death, have been reported in Viet Nam. Compared to the same period in 2020 (6,155 cases including two deaths), the cumulative number of cases decreased by 63.6%.
Southern Hemisphere

Australia

As of 2 January 2022 there had been one dengue case since 20 December 2021. Six cases of dengue have been reported in Australia from January to December 2021 (Figure 8). In contrast, there were 222 dengue cases reported in Australia from January to December in 2020 indicating a marked reduction in the number of cases. The significant drop in dengue cases for 2021 in Australia as compared to previous years during the same time period may be attributed to COVID-19 related travel restrictions. Prior to COVID-19, Australia had seen increasing notifications in overseas-acquired cases from returning travellers to dengue endemic areas.
**Pacific Islands Countries**

**French Polynesia (no update)**
During epidemiological weeks 43 and 44 of 2021, out of 16 suspected dengue cases tested for dengue-specific IgM, no samples tested positive. In 2021, the proportion of dengue-like illness (DLI) cases among consultations at sentinel sites (Figure 9) started to increase between weeks 31 and 34, along with a peak in COVID-19 cases.

**New Caledonia (no update)**
From epidemiological weeks 1 to 45 of 2021, a total of 116 dengue cases were reported in New Caledonia, including 92 confirmed cases, 23 probable cases, and one suspected case (Figure 10). This is an increase compared to the same period in 2020 when a total of 63 total dengue cases were reported, but the peak and majority of cases were reported at the beginning of the year and current trend is similar to last year. DENV-2 was detected in 85 out of the 92 confirmed cases as of 15 November 2021.

Wallis and Futuna (no update)
During epidemiological weeks 46 to 47 of 2021, no confirmed cases of dengue were reported in Wallis and Futuna (Figure 11). As of epidemiological week 47, 2021, there have been 68 cases reported. Among them, 63 cases were reported in Futuna and five cases reported in Wallis. In 2020, there were a cumulative of 124 confirmed dengue cases.

*Since week 44, the dengue surveillance bulletin of Wallis and Futuna has discontinued updating this graph.

Pacific Island Countries and Areas (PICs) – Dengue-like illness (DLI) Surveillance
During epidemiological week 2 of 2022, Pacific Island Countries and Areas with available surveillance data are reporting no or low numbers of DLI cases.
* Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
