Preface: The International Pharmacopoeia, Sixth Edition
2016

This is the Sixth Edition of The International Pharmacopoeia published in 2016.

The International Pharmacopoeia \[1\] (Ph.Int.) comprises a collection of recommended procedures for analysis and specifications for the determination of “pharmaceutical substances” (active pharmaceutical ingredients), excipients and “dosage forms” (general texts and individual finished pharmaceutical products) that is intended to serve as source material for reference or adaptation by any World Health Organization (WHO) Member State wishing to establish pharmaceutical requirements. The pharmacopoeia, or any part of it, shall have legal status whenever a national or regional authority expressly introduces it into appropriate legislation. Further explanation of the role of The International Pharmacopoeia is provided in the paragraph entitled “Scope and function” at the end of the text “The International Pharmacopoeia, Fifth Edition” in the folder “Background to previous editions of The International Pharmacopoeia”. A summary of the history and major changes in the previous versions is provided in the same folder.

The International Pharmacopoeia is based on advice and decisions from the WHO Expert Committee on Specifications for Pharmaceutical Preparations (ECSPP). All specifications included in this Sixth Edition have been developed following the WHO consultation process and were adopted by the ECSPP.

New and revised texts. New and revised texts are introduced for 12 monographs on pharmaceutical substances, 12 monographs on dosage forms, one method of analysis and three texts for the section on “Supplementary information”. A list of these texts is provided as an annex to this preface.

Omitted texts. Following a decision at the 49th meeting of the ECSPP, eighteen texts were omitted from the Fifth Edition; they are listed in the annex to this chapter. These texts are further accessible on the website of The International Pharmacopoeia (http://www.who.int/medicines/publications/pharmacopoeia/en/). Users of these texts may note that the documents are provided for information; they will neither be updated or revised nor will the prescribed International Chemical Reference Substances (ICRS) be further monitored for the analytical purpose mentioned in the monograph. Users will need to ensure that the described active pharmaceutical substances or dosage forms comply with current rules and regulations governing medicines in their respective territories and that the prescribed reference substances are still suitable for the intended use.

International Chemical Reference Substances. ICRS are primary chemical reference substances for use in physical and chemical tests and assays described in The International Pharmacopoeia. More information on ICRS can be found on the following website: http://www.who.int/medicines/areas/quality_safety/quality_assurance/qas_icrs/en/

Trade names of stationary phases. The selectivity of chromatographic tests may not only depend on the parameters mentioned in the methods’ descriptions but also on the material of the used stationary phases. The International Pharmacopoeia has provided on its website (http://www.who.int/medicines/publications/pharmacopoeia/en/) a list of trade name(s) of the stationary phase(s) that was (were) found to be suitable when new monographs were being developed. This information is provided solely for the convenience of users. The mentioned suppliers are neither endorsed nor recommended by The International Pharmacopoeia nor does the information imply any preference to other stationary phases of a similar nature which are not mentioned. The user should also be aware of the fact that some stationary phases can show significant batch-to-batch variations.

Scope and function

The activities related to The International Pharmacopoeia are an essential element in the overall quality control and assurance of pharmaceuticals contributing to the safety and efficacy of medicines.\[2\]

The selection of monographs for inclusion in The International Pharmacopoeia recognizes the needs of specific disease programmes and the essential medicines nominated under these programmes. The International Pharmacopoeia specifies primarily the quality of essential medicines that are listed:

- on the WHO Model List Of Essential Medicines (EML\[3\]);
- on the invitations to manufacturers to submit an expression of interest (EOI) to the WHO Prequalification Team – Medicines (PQT);
- in other United Nations (UN)/WHO documents recommending the use of medicines for the treatment of specific diseases and/or for use by treatment programmes.

The work on The International Pharmacopoeia is carried out in collaboration with members of the WHO Expert Advisory Panel on the International Pharmacopoeia and Pharmaceutical Preparations as well as with specialists from regulatory authorities, from industry and from other institutions (see under “Acknowledgements”). Clearly defined steps are followed in the development of new monographs.\[4\]

It is emphasized that pharmacopoeial specifications represent only one element of the quality assurance of medicines. Pharmaceutical substances and dosage forms for human use, as described in a monograph of The International Pharmacopoeia, should be manufactured according to the current requirements of good manufacturing practices.\[5\] The processes, premises,
equipment and installations should also comply with the provisions of the product license or marketing authorization, relevant regulations and, in the case of products destined for export, with any binding international norms that would affect their entry onto the market. In many cases this compliance cannot be verified by analysing a sample of the final product against a pharmacopoeial monograph. The national, regional or other competent authority will need to ensure that all relevant provisions have been met by any means at its disposal, including use of appropriate certificates, inspection of the manufacturing sites or testing of samples beyond specifications.

It should be understood that a distinction exists between pharmacopoeial standards and manufacturers' release specifications. Pharmacopoeial standards are publicly-available compliance specifications and provide the means for an independent check of the quality of a product at any time during its shelf life. Although release specifications must be compatible with pharmacopoeial specifications, they may differ in several respects. In order to ensure compliance with the pharmacopoeia the manufacturers’ specifications may need to be more exacting than corresponding pharmacopoeial requirements. The manufacturer is entitled to use other analytical methods for routine testing and, moreover, he/she may assure him/herself that the requirements of the pharmacopoeia will be met by means other than routinely performing all of the tests in the monograph.

The requirements of the monographs are not framed to detect all possible impurities. The present tests are designed to determine impurities on which attention should be focused, to fix the limits of those that are tolerable to a certain extent and to indicate methods for ensuring the absence of those that are undesirable. It is, therefore, not to be presumed that an impurity can be tolerated because it has not been precluded by the prescribed tests.

Pharmaceutical preparations (dosage forms) that are produced on a large scale and that will be stored before use should undergo testing to show physical and chemical stability during storage over the claimed shelf life. [6]

The degree of protection provided by pharmacopoeial standards will depend not only on their technical content but also to a great extent on how they are used. The specified tolerances and limits allow for the inherent variations that occur during production and packaging, as well as for subsequent degradation within normal handling and storage conditions and for any acceptable variance of analytical results.

When pharmacopoeial standards are used to establish the compliance of products with regulatory requirements, the following principles apply:

- the interpretation of a monograph must be in accordance with all general requirements and testing methods, texts or notices pertaining to it as found in this edition;
- no further tolerances are to be applied to the limits prescribed.

CD-ROM and online. This Sixth Edition is published simultaneously online and on CD-ROM.

ANNEX

NEW TEXTS

Pharmaceutical substances
- Clindamycin hydrochloride
- Estradiol cypionate
- Misoprostol
- Misoprostol dispersion

Dosage forms
- Carbamazepine chewable tablets
- Carbamazepine oral suspension
- Clindamycin hydrochloride capsules
- Dextromethorphan oral solution
- Flucytosine intravenous infusion
- Misoprostol tablets
- Norethisterone tablets

Supplementary information
- Levomethorphan limit test for dextromethorphan containing finished pharmaceutical products

REVISED TEXTS

Pharmaceutical substances
- Atazanavir sulfate
- Cycloserine
- Carbamazepine
- Dextromethorphan hydrobromide
- Flucytosine
- Levonorgestrel
- Medroxyprogesterone acetate
- Norethisterone

Dosage forms
- Artemether injection
- Artesunate for injection
- Carbamazepine tablets
- Cycloserine capsules
- Medroxyprogesterone injection

Methods of analysis
- High-performance liquid chromatography (1.14.4)

Supplementary information
- Notes for guidance: Dissolution testing of tablets and capsules
- Reference substances and reference spectra

OMITTED TEXTS

Pharmaceutical substances
- Bacitracin
- Bacitracin zinc
- Bleomycin hydrochloride
- Chlortetracycline hydrochloride
- Erythromycin (base)
- Neomycin sulfate
- Oxytetracycline dehydrate
- Oxytetracycline hydrochloride

Dosage forms
- Ampicillin capsules
- Colchicine tablets
- Ergometrine hydrogen maleate tablets
- Indometacin tablets
- Pethidine hydrochloride tablets
- Piperazine adipate tablets
- Piperazine citrate tablets
- Prednisolone sodium phosphate injection
- Prednisolone sodium succinate powder for injections
- Probenecid tablets
