

Agenda 19 – Poliomyelitis

While generations of progress have brought us within reach of a polio free world, transmission persists in the toughest contexts.

Gavi reaffirms its unwavering commitment to global polio eradication and to sustaining a polio-free future. As a core partner of GPEI, Gavi continues to expand access to inactivated poliovirus and hexavalent vaccines, and support strengthening routine immunisation systems, including through integrated delivery approaches.

The period ahead is critical: achieving our shared goals will require working with countries and partners to strengthen routine immunisation, close immunity gaps, and help secure the sustainable systems needed to finish eradication.

We call on Member States to:

1. *Promote* integrated approaches to reaching zero-dose and under-vaccinated children with life-saving vaccination and other primary health care interventions, especially in humanitarian and complex emergencies settings; and
2. *Accelerate* the transition of polio assets into national immunisation and health systems to safeguard long-term resilience.
