## Human infection with avian influenza A (H5) viruses

### Human infection with avian influenza A(H5N1) virus

From 25 to 31 January 2016, **no new cases** of human infection with avian influenza A(H5N1) virus were reported to WHO in the Western Pacific Region.

From February 2003 to 20 January 2015, 237 cases of human infection with avian influenza A(H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 57%.

**Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A(H5N1) virus infection reported to WHO (January 2003 to 20 January 2015), Western Pacific Region.**

Country	2003		2004		2005		2006		2007		2008		2009		2010		2011		2012		2013		2014		2015		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D
Cambodia	0	0	0	0	4	4	2	2	1	1	1	0	1	0	1	1	8	8	3	3	26	14	9	4	0	0	56	37
China	1	1	0	0	8	5	13	8	5	3	4	4	7	4	2	1	1	1	2	1	2	2	2	0	5	1	52	31
Lao PDR	0	0	0	0	0	0	0	0	2	2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	2	2
Viet Nam	3	3	29	20	61	19	0	0	8	5	6	5	5	5	7	2	0	0	4	2	2	1	2	2	0	0	127	64
<b>Total</b>	<b>4</b>	<b>4</b>	<b>29</b>	<b>20</b>	<b>73</b>	<b>28</b>	<b>15</b>	<b>10</b>	<b>16</b>	<b>11</b>	<b>11</b>	<b>9</b>	<b>13</b>	<b>9</b>	<b>10</b>	<b>4</b>	<b>9</b>	<b>9</b>	<b>9</b>	<b>6</b>	<b>30</b>	<b>17</b>	<b>13</b>	<b>6</b>	<b>5</b>	<b>1</b>	<b>237</b>	<b>134</b>

From February 2003 to 20 January 2015, there have been 846 cases of human infection with avian influenza A(H5N1) virus reported from 16 countries worldwide. Of these cases, 449 were fatal, resulting in a CFR of 53.1%.

### Human infection with avian influenza A (H5N6) virus

From 25 to 31 January 2016, **1 new case** of human infection with avian influenza A(H5N6) virus from China was reported on the Disease Outbreak News. Since May 2014, **nine human cases** of influenza A(H5N6) have been reported and all nine of these were reported from China.

### Public health risk assessment for human infection with avian influenza A(H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments, therefore sporadic human cases would not be unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A(H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses.

*For more information on confirmed cases of human infection with avian influenza A (H5) virus reported to WHO, visit:*

## Human infection with avian influenza A (H7N9) virus in China

From 25 to 31 January 2016, **no new cases** of human infection with avian influenza A (H7N9) virus from the Western Pacific Region were reported. The last case was reported on 19 January 2016.

<http://www.who.int/csr/don/19-january-2016-avian-influenza-china/en/>

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments with new information. Overall, the public health risk from avian influenza A (H7N9) viruses has not changed.

Further sporadic human cases of avian influenza A (H7N9) infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans.

### Public health risk assessment for avian influenza A (H7N9) viruses

On 23 February 2015, WHO conducted a public health risk assessment for avian influenza A (H7N9). This assessment found the overall public health risk from avian influenza A (H7N9) viruses has not changed since the previous assessment, published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of avian influenza A (H7N9) virus.
