

Human infection with avian influenza A (H5) viruses

Human infection with avian influenza A (H5N1) virus

From 03 June to 10 June 2016, **no new cases** of human infection with avian influenza A (H5N1) virus were reported to WHO in the Western Pacific Region.

From February 2003 to 10 June 2016, a total of 238 cases of human infection with avian influenza A (H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 56%.

Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A (H5N1) virus infection reported to WHO (January 2003 to 4 April 2016), Western Pacific Region.

Country	2003-2010		2011		2012		2013		2014		2015		2016		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D
Cambodia	10	8	8	8	3	3	26	14	9	4	0	0	0	0	56	37
China	40	26	1	1	2	1	2	2	2	0	6	1	0	0	53	31
Lao PDR	2	2	0	0	0	0	0	0	0	0	0	0	0	0	2	2
Viet Nam	119	59	0	0	4	2	2	1	2	2	0	0	0	0	127	64
Total	171	95	9	9	9	6	30	17	13	6	6	1	0	0	238	134

From February 2003 to 10 June 2016, there have been 850 cases of human infection with avian influenza A (H5N1) virus reported from 16 countries worldwide. Of these cases, 449 were fatal, resulting in a CFR of 52.8%.

Human infection with avian influenza A (H5N6) virus

From 03 June to 10 June 2016, **one (1) new case** of human infection with avian influenza A (H5N6) virus was reported to WHO in the Western Pacific Region. The case is a 50-year-old male living in Xiangxi Autonomous Prefecture, Hunan Province. Date of illness onset was on 23 May 2016. The case was in a critical condition at the time of report. Since May 2014, a total of 13 laboratory confirmed cases of human infection with influenza A (H5N6) virus have been reported. All cases have been reported from China.

Public health risk assessment for human infection with avian influenza A (H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments, therefore sporadic human cases would not be unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A (H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses.

For more information on confirmed cases of human infection with avian influenza A (H5) virus reported to WHO, visit: http://www.who.int/influenza/human_animal_interface/en/

Human infection with avian influenza A (H7N9) virus in China

From 03 June to 10 June 2016, **no new cases** of human infection with avian influenza A (H7N9) virus from the Western Pacific Region were reported. The last eleven cases were reported on 10 May 2016. <http://www.who.int/csr/don/17-may-2016-ah7n9-china/en/>

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments with new information. Overall, the public health risk from avian influenza A (H7N9) viruses has not changed.

Further sporadic human cases of avian influenza A (H7N9) infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans.

Public health risk assessment for avian influenza A (H7N9) viruses

On 23 February 2015, WHO conducted a public health risk assessment for avian influenza A (H7N9). This assessment found the overall public health risk from avian influenza A (H7N9) viruses has not changed since the previous assessment, published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of avian influenza A (H7N9) virus. Human infections with the A (H7N9) virus are unusual and need to be monitored closely in order to identify changes in the virus and/or its transmission behaviour to humans as it may have a serious public health impact.

Animal infection with avian influenza

From 03 June to 10 June 2016, there was **one (1) new report of animal infection** with avian influenza virus reported in the Western Pacific Region; in Hong Kong SAR, China [H7N9].

H7N9 detected in poultry market, Hong Kong SAR, China:

H7N9 infection was reported from faecal droppings of live poultry in a market in Tuen Mun district. The positive sample was detected on 4 June 2016 through the routine surveillance programme for avian influenza in markets and fresh provision shops. The live poultry stalls at the market have been closed for thorough disinfection and cleansing, and investigations are underway to trace the source of the virus.
