

## Human infection with avian influenza A(H5) viruses

### Human infection with avian influenza A(H5N1) virus

From 2 to 9 December 2016, no new cases of human infection with avian influenza A(H5N1) virus were reported to WHO in the Western Pacific Region.

From January 2003 to 1 December 2016, a total of 238 cases of human infection with avian influenza A(H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). The last case was reported on 14 January 2016. Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 56%.

**Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A (H5N1) virus infection reported to WHO (January 2003 to 1 December 2016), Western Pacific Region.**

Country	2003-2010		2011		2012		2013		2014		2015		2016		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D
Cambodia	10	8	8	8	3	3	26	14	9	4	0	0	0	0	56	37
China	40	26	1	1	2	1	2	2	2	0	6	1	0	0	53	31
Lao PDR	2	2	0	0	0	0	0	0	0	0	0	0	0	0	2	2
Viet Nam	119	59	0	0	4	2	2	1	2	2	0	0	0	0	127	64
<b>Total</b>	<b>171</b>	<b>95</b>	<b>9</b>	<b>9</b>	<b>9</b>	<b>6</b>	<b>30</b>	<b>17</b>	<b>13</b>	<b>6</b>	<b>6</b>	<b>1</b>	<b>0</b>	<b>0</b>	<b>238</b>	<b>134</b>

From January 2003 to 1 December 2016, there were 856 cases of human infection with avian influenza A(H5N1) virus reported from 16 countries worldwide. Of these cases, 452 were fatal, resulting in a CFR of 52.8%.

### Human infection with avian influenza A(H5N6) virus

One additional human infection with avian influenza A(H5N6) virus was reported to WHO on 1 December 2016 (source: <http://www.who.int/csr/don/07-december-2016-ah5n6-china/en/>). This case was a 30-year-old female living in Guangxi Province, China who developed the disease on 8 November 2016. She was hospitalized on 18 November 2016 and was in critical condition at the time of report. She had a history of exposure to dead poultry prior to disease onset. 127 close contacts are being monitored, and none of them have developed symptoms at the time of report.

### Public health risk assessment for human infection with avian influenza A(H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments; therefore sporadic human cases are not unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A(H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses.

For more information on confirmed cases of human infection with avian influenza A(H5) virus reported to WHO, visit: [http://www.who.int/influenza/human\\_animal\\_interface/en/](http://www.who.int/influenza/human_animal_interface/en/)

## Human infection with avian influenza A(H7N9) virus in China

From 2 to 9 December 2016, no new cases of human infection with avian influenza A(H7N9) virus from the Western Pacific Region were reported. The last case was reported on 17 November 2016. <http://www.who.int/csr/don/17-november-2016-ah7n9-china/en/>

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments with new information. Overall, the public health risk from avian influenza A(H7N9) viruses has not changed.

Further sporadic human cases of avian influenza A(H7N9) virus infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans.

### Public health risk assessment for avian influenza A(H7N9) virus

On 23 February 2015, WHO conducted a public health risk assessment for avian influenza A(H7N9). This assessment found the overall public health risk from avian influenza A(H7N9) viruses has not changed since the previous assessment, published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of avian influenza A(H7N9) virus. Human infections with the A(H7N9) virus are unusual and need to be monitored closely in order to identify changes in the virus and/or its transmission behaviour to humans as it may have a serious public health impact.

## Animal infection with avian influenza virus

From 2 to 9 December 2016, additional animal outbreaks with avian influenza virus were reported in Republic of Korea and Hong Kong SAR, China.

### Highly pathogenic avian influenza (HPAI) H5N6 virus infection in poultry, Republic of Korea

On 2 Dec 2016, OIE reported new additional 6 farms which bred a bird infected with H5N6 virus. Total number of farms which bred a bird infected with H5N6 virus are 20 since H5N6 virus appeared two weeks ago. A total of 4,790 poultry died and 235,834 poultry were culled.

### Highly pathogenic avian influenza (HPAI) H5N6 virus infection in poultry, Hong Kong SAR, China

On 5 Dec 2016, OIE reported three H5N6 positive samples of fecal droppings of birds at Mai Po Nature Reserve in Hong Kong. An intensive surveillance system is in place for avian influenza virus, including screening in the area. Three environmental samples were collected for the routine academic surveillance study by University of Hong Kong on 25 November 2016 and subsequently tested positive for H5N6.

### Highly pathogenic avian influenza (HPAI) H5N6 virus infection in poultry, Japan

Two outbreaks of AI H5 virus infection in poultry were reported last week in Aomori and Niigata. The N-type was identified as N6 by National Institute of Animal Health on 5 December 2016. A total of 245 poultry died and 572,638 poultry were culled.
