The WHO Regional Office for Europe

The World Health Organization (WHO) is a specialized agency of the United Nations created in 1948 with the primary responsibility for international health matters and public health. The WHO Regional Office for Europe is one of six regional offices throughout the world, each with its own programme geared to the particular health conditions of the countries it serves.

European regional status report on road safety 2019

The 4th Global Status Report Study estimated that more than 80,000 people were killed from road-traffic injuries in the WHO European Region in 2016, representing 6% of road-traffic deaths worldwide. Decreasing by 13% between 2010 and 2016, the WHO European and Western Pacific regions are the only WHO regions to show reductions in road-traffic mortality since the global community adopted the visionary but ambitious United Nations Sustainable Development Goal (SDG) target to “halve the number of road traffic death and injuries by 2020”. Reductions in mortality have been achieved despite 14% growth in the number of registered vehicles. While the European Region has the lowest road-traffic mortality rate of any WHO region (8.8 deaths per 100,000 population compared to 18.2 per 100,000 globally), wide variation continues to persist, with a seven-fold difference between countries with the highest and lowest road-traffic mortality rates. Should the fall in the number of deaths continue at its current pace, SDG target 3.6 will not be met. This report assesses the laws and practices on key risk factors, such as regulating speed appropriate to road type, drink–driving, and use of seat belts, motorcycle helmets and child restraints to reduce the risk of road-traffic injury.
EUROPEAN REGIONAL STATUS REPORT ON ROAD SAFETY 2019
Abstract
The fourth Global Status Report Study estimated that more than 80,000 people were killed from road-traffic injuries in the WHO European Region in 2016, representing 6% of road-traffic deaths worldwide. Decreasing by 13% between 2010 and 2016, the WHO European and Western Pacific regions are the only WHO regions to show reductions in road-traffic mortality since the global community adopted the visionary but ambitious United Nations Sustainable Development Goal (SDG) target to “halve the number of road traffic death and injuries by 2020”. Reductions in mortality have been achieved despite 14% growth in the number of registered vehicles. While the European Region has the lowest road-traffic mortality rate of any WHO region (8.8 deaths per 100,000 population compared to 18.2 per 100,000 globally), wide variation continues to persist, with a seven-fold difference between countries with the highest and lowest road-traffic mortality rates. Should the fall in the number of deaths continue at its current pace, SDG target 3.6 will not be met. This report assesses the laws and practices on key risk factors, such as regulating speed appropriate to road type, drink–driving, and use of seat belts, motorcycle helmets and child restraints to reduce the risk of road-traffic injury.

ACKNOWLEDGEMENTS

This report was written by Jonathon Passmore and Yongjie Yon (WHO Regional Office for Europe). It uses data from the Global status report on road safety 2018. Nhan Tran, Anesh Sukhai, Kacem Iaych and Joelle Auert from WHO headquarters provided support for coordination of the project, data analysis and interpretation of road-safety laws.

The authors are very grateful to ministry of health and other government-appointed national data coordinators for their dedicated hard work in collecting the country information for the survey questionnaire, and government officials who cleared the data. Yongjie Yon, as the Regional Data Coordinator, worked with the national data coordinators to coordinate data collection. WHO representatives and staff at country level facilitated the collection of data for this report and their contribution is greatly acknowledged.

Thanks are extended to the interns and volunteers from the Violence and Injury Prevention programme at the WHO Regional Office for Europe, who supported validation of the data and development of the report: Anda Llanaj (University of Melbourne, Australia), Akash Makhija (Boston University, United States of America), Dmytro Metilka (New University of Lisbon, Portugal), Gabriella Sutton (University of Malta), Gianluca Di Giacomo (Catholic University of the Sacred Heart, Italy), Julia Mutevelli (University of Bonn, Germany), Maria Ramiro Gonzalez (General University Hospital Gregorio Maranon, Spain) and Marijn van Waardenburg (Maastricht University, the Netherlands).

Generous financial support from Bloomberg Philanthropies made this analysis and publication possible.
FOREWORD

Each year, over 80,000 lives are tragically lost on our roads. Whether the victims are young or older, passenger, driver or pedestrian, each person whose life is suddenly cut short is someone’s child, parent, partner or friend. Every day, family and friends relive those moments when their loved ones were suddenly robbed of their lives.

Yet the truth is that every one of these deaths could have been prevented. Road-traffic crashes are not mere accidents or random acts. They are highly predictable, and therefore preventable.

This report shows that over 221 people are killed on roads every day in the WHO European Region. Thousands more are injured or disabled, with long-lasting effects. The number of deaths and severe injuries from road crashes depends on where we live. People from the eastern part of our Region bear the highest burden of road-traffic mortality and morbidity. But regardless of where these tragedies occur, the grief and anguish are all too similar for families, with communities and wider society enduring the immense burden of economic and productivity loss.

Perhaps one of the most distressing facts in this report is that road-traffic crashes are the leading cause of all death for young children aged between 5 and 14 years. No child should die or be seriously injured on our roads while they walk, cycle or play.

Although our Region is one of only two that have seen a reduction in road-traffic fatality, progress has not occurred at a pace fast enough to achieve the global target of halving road-traffic deaths by 2020. There are many reasons for this modest progress: rapid urbanization and motorization, poor safety standards and infrastructure, lack of strong enforcement, drivers being distracted or under the influence of drugs or alcohol, speeding and a failure to wear seat belts or helmets, and lack of access to timely post-crash care.

The United Nations Sustainable Development Goals towards 2030, together with the 12 voluntary global performance targets for road safety, provide renewed actions for halving road-traffic deaths. WHO’s extensive catalogue of normative and technical guidance for strengthening road safety is based on the recommended safe-systems approach to road safety. This approach recognizes that the human body is highly vulnerable to injury and that humans make mistakes, but that a set of complementary interventions, to create safer roads, safer vehicles, safer speeds and safer behaviour by road users, work together to accommodate error.

This European regional status report on road safety describes the progress made by governments in the Region. The report is based on a detailed survey of status reports on road safety completed by government-appointed national data coordinators in 51 of 53 Member States of the Region.
We at the WHO Regional Office for Europe hope this report will provide policy-makers, practitioners and activists with the information and guidance needed to continue momentum for the safe-system approach for road safety and ensure that families are spared from the unimaginable suffering of losing a loved one or living with the trauma and disability caused by these devastating and life-altering events.

KEY MESSAGES

→ WHO estimates that 80,559 people were killed in road-traffic crashes in the WHO European Region in 2016, representing 6% of global road-traffic deaths.

→ The WHO European Region has the lowest road-traffic mortality rate of any WHO region at 8.8 per 100,000 population, compared to the global rate of 18.2 per 100,000.

→ Between 2010 and 2016, road-traffic injury deaths in the European Region decreased by 13%, despite an overall increase of 14% in registered motor vehicles.

→ Road crashes are the leading cause of death for children aged 5–14 years.

→ Over 40% of those killed on the roads are pedestrians (25%), cyclists (5%) and motorcyclists (11%).

→ The risk of dying from road crashes varies widely across the Region, with a higher risk of dying among men (74%), young adults (aged 15–29, at 24%) and older people (aged 70+, at 15%), as well as populations living in low- and middle-income countries (70%).

→ Mortality due to road-traffic injury is almost seven times higher in the country with the highest rate than in that with the lowest rate.

→ Forty-six of 51 countries report having national road-safety strategies, but full funding for implementation is present only in nine countries, with partial funding in a further 36.

→ Only five countries have road-safety legislation in line with WHO good practice recommendations for all five behavioural risk factors (speed, alcohol, motorcycle helmets, seat belts and child restraints).

→ Forty-five countries have road-traffic legislation that meets best practice with at least one risk factor, but only five have changed laws to bring them in line with best practice on all five key risk factors: speed, drink-driving, motorcycle helmet use, seat-belt use and child restraints.

→ Forty-nine countries have full or partial safety reviews for the design and planning of new road infrastructure.

→ Thirty-one countries, representing over 520 million people, have implemented all eight priority United Nations vehicle-safety standards.

→ Every country in the Region has a single emergency care access number, with full national coverage.

→ The Sustainable Development Goal target 3.6 to halve road deaths and injuries by 2020 will not be met without drastic action.
INTRODUCTION
INTRODUCTION

Road-traffic injuries are a leading killer of young people aged 5–29 years in the WHO European Region (1). In 2010, the United Nations General Assembly adopted the Decade of Action for Road Safety 2011–2020 to reduce the global toll of road-traffic injuries by 2020 (2). As a baseline for measuring progress, WHO published the Global status report on road safety 2013: supporting a decade of action (3), together with European facts and Global status report on road safety 2013 (4). In 2015, the historic Sustainable Development Goals (SDGs) were adopted by the United Nations General Assembly. Reflective of its importance to international development agendas, the SDGs include two specific targets on road safety: goal 3.6 seeks to halve the number of global deaths and injuries from road-traffic crashes by 2020, while goal 11.2 aims to provide access to safe and sustainable transport systems (5). Road safety is also recognized as a priority area in the Health 2020 European policy framework for health and well-being (6). The European Union (EU) road-safety policy framework 2011–2020 has a target of a 50% reduction in fatalities by 2020 (7).

WHO’s technical recommendations for strengthening road safety are based on the safe-systems approach. Safe systems recognize that humans are both fallible and fragile. The human body is highly vulnerable to injury and humans make mistakes, but a set of complementary interventions to create safer roads, safer vehicles, safer speeds and safer behaviour by road users work together to accommodate the consequences of error and prevent inevitable crashes from resulting in death and serious injuries. Safe-systems, or so-called vision-zero, approaches to road safety gradually are gaining political traction, but the approaches require technical fail-safes to ensure implementation according to these principles rather than incorrect use as a label for road-safety actions that are neither data-driven nor evidence-based. The safe-systems approach provides a holistic framework to examine the risk factors and interventions of road-traffic injuries (Fig. 1) (8–10).

Against this backdrop of international actions on road safety, a notable global development has emerged to assist countries to renew their focus on road-safety management initiatives. In 2017, Member States, with the support of WHO, the United Nations Economic Commission for Europe (UNECE), the United Nations Children’s Fund, the World Bank and other agencies reached consensus on a set of 12 voluntary global performance targets for road-safety risk factors and service-delivery mechanisms (Box 1) (11). These voluntary targets provide a framework to guide and monitor implementation of legislation and the establishment of standards and other interventions to prevent crashes, injuries and deaths that are highlighted in this report.

INTRODUCTION

This report describes the status of road safety in 51 of the 53 Member States of the WHO European Region, representing almost 100% of the Region’s population. It takes stock of progress in the Region towards achieving the global target of halving the number of road-traffic deaths by 2020 and aims to:

→ examine the current road-safety situation in the Region;
→ provide an assessment of progress towards the United Nations goals for road safety;
→ review the status of road-safety agencies in the Region;
→ present an analysis of national legislation on key road-safety risk factors using best-practice criteria;
→ assess the current state of vehicle standards and road infrastructure; and
→ analyse progress and challenges in improving post-crash care.

The report emphasizes that road-traffic injuries are a public health and societal problem of serious dimensions. It presents evidence to mobilize key road-safety actors and calls on policy-makers to take greater action. Given the multisectoral nature of road safety and the diversity of actors involved (including those from transport, finance, education, health and interior/police), the report advocates that road safety is a shared responsibility among all sectors. It therefore aims to persuade people from multiple disciplines and sectors to work together and place people at the centre of transportation systems. The main section of the report describes the regional overview of the burden of road-traffic injuries, followed by each of the pillars of the safe-system approach. The report concludes with a discussion on progress made in reducing road-traffic injuries and proposals for a way forward. Country profiles of all responding countries are provided in the report, with key indicators of road safety.

---

1 Andorra and Monaco did not participate in this report.
GLOBAL ROAD SAFETY PERFORMANCE TARGETS

**Target 1:** By 2020, all countries establish a comprehensive multisectoral national road safety action plan with time-bound targets.

**Target 2:** By 2030, all countries accede to one or more of the core road safety-related UN legal instruments.

**Target 3:** By 2030, all new roads achieve technical standards for all road users that take into account road safety, or meet a three star rating or better.

**Target 4:** By 2030, more than 75% of travel on existing roads is on roads that meet technical standards for all road users that take into account road safety.

**Target 5:** By 2030, 100% of new (defined as produced, sold or imported) and used vehicles meet high quality safety standards, such as the recommended priority UN Regulations, Global Technical Regulations, or equivalent recognized national performance requirements.

**Target 6:** By 2030, halve the proportion of vehicles travelling over the posted speed limit and achieve a reduction in speed-related injuries and fatalities.

**Target 7:** By 2030, increase the proportion of motorcycle riders correctly using standard helmets to close to 100%.

**Target 8:** By 2030, increase the proportion of motor vehicle occupants using safety belts or standard child restraint systems to close to 100%.

**Target 9:** By 2030, halve the number of road traffic injuries and fatalities related to drivers using alcohol, and/or achieve a reduction in those related to other psychoactive substances.

**Target 10:** By 2030, all countries have national laws to restrict or prohibit the use of mobile phones while driving.

**Target 11:** By 2030, all countries to enact regulation for driving time and rest periods for professional drivers, and/or accede to international/regional regulation in this area.

**Target 12:** By 2030, all countries establish and achieve national targets in order to minimize the time interval between road traffic crash and the provision of first professional emergency care.

Source: WHO (11).
METHODS

Data were collected through a standardized and self-administered questionnaire between 2017 and 2018. The questionnaire was administered by the Regional Office with national data coordinators appointed by governments to coordinate country submissions (12) (Annex 1). The national data coordinators and experts from several sectors in each country reached consensus to complete the questionnaire. Using this method, data were collected on: (i) road-traffic fatality for 2016; (ii) key policy indicators; (iii) legislation on the established behavioural risk factors of speed, drink–driving and non-use of motorcycle helmets, seat belts and child car restraints, as well as the emerging risk factors of mobile phone use and drug–driving; and (iv) road safety audits and mobility. Additional information, including road inspection data from the International Road Assessment Programme (iRAP) and vehicle standards from the UNECE database, were collected. All data were validated by national and WHO experts. A more detailed description of the methodology on data collection is provided in the Global status report on road safety 2018 (12) and Annex 2. A detailed description of the methodology used to generate WHO estimates on road traffic deaths for 2016 for all Member States is provided in the Global status report on road safety 2018 (12) and Annex 3.

ESTIMATION AND ANALYSIS

Based on data collected from individual countries on the reported number of road-traffic fatalities and source data, adjustments were made by WHO to account for potential underreporting due to differences in definitions and limitations in civil registration and vital statistics in some countries. This was followed by a country consultation to allow Member States to validate the data and respond to any changes that resulted from the process. Both the reported number of road-traffic fatalities collected from the country and the WHO estimates are presented in the country profiles.

Since the last global and regional reports published in 2015 (13,14), criteria to assess best practices for legislation on key road-safety risk factors have further been updated. Using the updated criteria, individual items of laws on behavioural risk factors from the previous report were analysed retrospectively and compared with the analysis of legislation for this report.
THE BURDEN OF ROAD-TRAFFIC INJURIES IN EUROPE
Road-traffic injuries killed more than 80 000 people in the WHO European Region in 2016.

In 2016, 80 559 people died from road-traffic injuries in the European Region – about 221 every day. This number represented about 6% of global road-traffic deaths and constitutes a decrease of over 12 000 deaths (or 13.4%) over a six-year period, from 2010 to 2016 (1). The greatest progress was in EU countries, with deaths decreasing by 23.9%, compared to 10.3% in the Commonwealth of Independent States (CIS) (1). While this decline constitutes a considerable success in prevention efforts, it is not sufficient to meet the 2020 target.

The 13.4% overall reduction in road-traffic deaths since 2010 is equivalent to about a 2.2% annual average reduction. A 6.7% year-to-year reduction is needed over the 2010–2020 period to reach the 2020 target of a 50% reduction through constant progress in annual percentage terms. This reduction has not been achieved: consequently, the Region now must reduce the number of road-traffic deaths by 13.5% each year between 2017 and 2020 to be on track for the target. Should the fall in the number of deaths continue at its current pace, the Region will not achieve the target.

Strong political will and urgent measures are needed to close the gap between the desired and actual progress. Implementation of an integrated road-safety approach that includes increased traffic law enforcement and treatment of high-risk sites, enforcement of safety standards for roads and vehicles and improvement of access to prehospital care are among the measures that can have immediate positive effects in saving lives from road-traffic crashes.

---

2 EU countries comprise the 28 Member States as of 2016: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden and the United Kingdom.

3 CIS countries included in 2016: Armenia, Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, Republic of Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine and Uzbekistan.
The European Region has the lowest road-traffic mortality rate of any WHO region, but mortality rates vary widely across the Region.

The mortality rate from road-traffic injury in the European Region is 2.1 times lower than the global average (8.8 deaths per 100,000 population, relative to 18.2 per 100,000 globally) and is lower than that in the other WHO regions. Mortality rates due to road-traffic injuries vary greatly across countries in the Region, however. Country mortality rates range from 18.1 to 2.7 per 100,000 people. Countries belonging to the CIS have a road-traffic mortality rate that is 2.5 times higher than that of the EU (Fig. 2). When grouped together by income classifications, road-traffic mortality rates in low- and middle-income countries (LMIC) are 2.6 times higher than in high-income countries (HICs4) (Fig. 3).

4 The World Bank Atlas method was used to categorize gross national income into bands of: low- and middle-income = US$12,235 or less; and high-income = US$12,236 or more. Where no data were available for 2016, published data for the latest year from the World Bank world development indicators database were used (15).
The burden of road-traffic deaths is disproportionately high among LMICs in relation to the size of their populations and the number of motor vehicles in circulation. Although only 26% of the Region’s motor vehicles are in LMICs, 70% of deaths occur in these countries. This higher burden of deaths constitutes an issue of equity, as income and social status become social determinants of road-traffic deaths and injury (16). The lessons learned from the coordinated and evidence-based approaches in HICs must be shared and adapted for LMICs to reduce road-traffic injury and close the gap.

Mortality due to road-traffic injury is 6.7 times higher in the country with the highest rate than that in the country with the lowest rate.

The lowest mortality rates are in western Europe in countries such as Switzerland and Norway, while the highest are in some of the CIS countries (Fig. 4). The rates in Switzerland and Norway are 6.7 times lower than the country with the highest rate. If every country achieved a similar level of road safety as Switzerland and Norway,
more than 55 000 lives would be saved every year. A systematic approach with concerted policy action and societal commitment is needed to reduce road-traffic deaths and injuries (12,17).

Fig. 4. Mortality rates from road-traffic injuries per 100 000 population in HICs and LMICs in the WHO European Region\(^a\)\(^b\)

\(^a\)Data shown are for 50 out of the 51 participating countries. San Marino was excluded due to population under 200 000. Road-traffic mortality rates for San Marino are not available in this period.

\(^b\)Modelled mortality rates; for details of the modelling process, please see the Global status report on road safety 2018 (12).
Forty countries reported fewer road-traffic deaths in 2016 than in 2010. Forty countries have made progress in reducing the number of road-crash deaths (Fig. 5). Since the baseline measure in 2010, the European Region achieved an overall 13.4% reduction in deaths between 2010 and 2016 despite an increase of 14% in the number of registered vehicles in the same period (1,3,4). Motorization has been higher at 25% in countries belonging to the CIS. Nevertheless, countries such as Kazakhstan have managed to limit the increase in the number of deaths to less than 5% despite a 35% increase in vehicles through sustained policy interventions (Fig. 6).

*
These data represent countries that have seen more than a 2% change in their number of deaths since 2010, and excludes countries with populations under 200,000. Countries with populations of fewer than 1 million are more likely to be affected by statistical uncertainty and annual variations may appear large due to the small numbers.

The following countries have made progress in reducing road-crash deaths since 2010: Albania, Armenia, Austria, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Czechia, Denmark, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, Ireland, Israel, Italy, Latvia, Lithuania, Malta, Montenegro, Netherlands, North Macedonia, Norway, Poland, Portugal, Republic of Moldova, Romania, Russian Federation, Serbia, Slovakia, Slovenia, Spain, Switzerland, Ukraine, and United Kingdom. In contrast, six countries have increased the number of road-crash deaths since 2010: Iceland, Kazakhstan, Luxembourg, Tajikistan, Turkey, and Turkmenistan.
Every four in 10 people killed on the road are pedestrians, cyclists or motorcyclists.

Pedestrians and cyclists represent 30% of all road-traffic deaths in the Region, with those using motorized two- and three-wheelers comprising another 11%. These vulnerable road users are not well protected from the impact of a crash and together comprise 41% of all road-traffic fatalities (Fig. 7). Compared with the European Region and the EU, the proportion of pedestrian deaths is highest in CIS countries, while the proportions of cyclist and motorcyclist deaths are highest in the EU.
Males of all ages have the greatest risk for road-traffic injuries.

Mortality rates due to road-traffic injuries also vary by gender and age. Seventy-four per cent of all people killed on the Region’s roads in 2016 were male. Fig. 8 shows that the rates are three times higher in males than females. Rates are highest in young people aged 15–29 years (24%) and older people aged 70 years or more (15%). In HICs, 27% and 54% of deaths occurred in these age groups; in LMICs, the percentages were 74% and 46% respectively.

Road-traffic injury is now the leading cause of death for children aged 5–14 and the second leading cause of death for young adults aged 15–29 (1). The vulnerability of children and young adults signals an urgent need for increased emphasis on road-traffic injuries in the child and adolescent health agenda.

Prevention of road-traffic injury should also be recognized as a priority issue for economic development and poverty reduction because of its greater impact on people who are economically active and the growing older population.
Road-traffic fatalities are just the tip of the iceberg.

Deaths due to road crashes are only the tip of the injury iceberg, as they do not convey the full magnitude of the tragedies and grief road crashes create. For every death, there could be many cases of non-fatal injuries resulting in disabilities that have devastating impacts on people’s lives and impose high burdens and costs on health-care systems and societies.

No data on the severity of injuries are being collected systematically in the Region, so police reports and hospital data are often the data sources for non-fatal injuries. The European Association for Injury Prevention and Safety Promotion (EuroSafe) estimated that over 3 million people in the EU were injured in road crashes each year between 2012 and 2014 (18).

For every person who died from road-traffic injury between 2012 and 2014, 20 people (over 600,000 cases every year) were admitted to hospital and another 89 (over 2.7 million cases every year) were treated as hospital outpatients – amounting to 109
non-fatal road-traffic injuries for each fatality (18). This suggests that the reported figure of non-fatal road-traffic injuries might be an underestimate of the size of the problem in the Region. The European Commission provided, for the first time, an EU-wide estimate of 135 000 people being seriously injured on EU roads in 2014 (19). This estimate required the adoption by all EU Member States of a common definition of what constitutes a serious road injury, which is defined as a hospital inpatient with an injury level of Maximum Abbreviated Injury Score (MAIS) 3 or more (Box 2).

**Box 2. MAIS**

The Abbreviated Injury Scales (AIS) is a globally accepted trauma classification of injuries. It ranges from 1 (minor injuries) to 6 (non-treatable injuries) and is used by medical professionals to describe the severity of injury for each of the nine regions of the body (head, face, neck, thorax, abdomen, spine, upper extremity, lower extremity, external and other). As a person can have more than one injury, the MAIS is the maximum AIS of all injury diagnoses for a person.

The numbers of serious injuries based on MAIS3+ are not yet fully comparable among EU Member States due to different methods used for MAIS3+ data collection and varying quality of data.

*Source: European Transport Safety Council (19).*

Many road-traffic injuries have lifelong consequences for the individuals involved and their families.

Every person whose life is suddenly cut short or severely affected is one too many. Road-traffic injuries can have a devastating impact on the lives of many people. The humanitarian, health and other consequences are also vast. Information on the far-reaching consequences of road crashes on people’s lives is scarce. For example, only 11 countries⁶ provided estimates of the proportion of road-traffic crashes resulting in a permanent disability; these range from 0.8% to 25%, with a median of 6% (latest data available between

---

*The 11 countries reporting the proportion of road-traffic crashes resulting in a permanent disability are: Azerbaijan, Belgium, Finland, France, Italy, Kazakhstan, the Netherlands, North Macedonia, Romania, Spain and Sweden.*
2008 and 2016). These data are likely to underestimate the scale of the problem and better information on the severity of injuries leading to disability is needed.

**The economic burden to society warrants increased action across all sectors in countries.**

Twenty-eight countries have conducted studies to calculate the economic costs of road crashes as a proportion of their gross domestic product (GDP). Reported societal costs due to road crashes range from 0.4–4.1% of GDP. More estimates are needed, using a standardized methodology to assess GDP loss. Analysis of the progress on road safety of EU countries has shown that more than 30 000 road deaths were prevented between 2011 and 2017; the total value of reductions in this period is about €70 billion. As is the case across the European Region, had the EU been able to reduce road-traffic deaths at a constant rate of 6.7%, close to 20 000 more lives could have been saved, with an additional value of €40 billion savings in human costs. In other words, the total value of the benefit to society would have increased to about €110 billion (19). The high value of societal costs avoided (and those that could have been avoided) provide a clear investment case for policy-makers across sectors on road safety.
SAFER SPEED
Reducing urban speed limits is essential to protecting and saving the lives of pedestrians and cyclists.

The likelihood of a crash increases exponentially as speed increases, resulting in serious injury and death (20). For every 1% increase in mean speed, there is a 4% increase in fatal-crash risk and a 3% increase in serious-crash risk (21).

Despite the dangers of speed, its practice is ubiquitous. A study among Organisation for Economic Co-operation and Development countries showed that up to 80% of drivers admitted to driving above the posted speed limits, and a similar proportion of excessive speed has also been found in LMICs (22,23). The severity of injury is particularly critical for vulnerable road users, including pedestrians, cyclists and motorcyclists, as well as young and older adults. With travelling speed being directly associated with human survivability in the event of a crash, legal speed limits must be determined based on safe-systems principles. A growing number of countries have formal guidelines on the process by which speed limits are established based on the type and function of road infrastructure. For countries belonging to the EU, Intelligent Speed Assistance, a technology that supports drivers in keeping to posted speed limits, will become mandatory on all new vehicles from 2022 (24).

Speed limits in urban areas, where motorized traffic meets pedestrians, cyclists and motorcycle riders, need to take account of the safety of all road users (12,25,26). Forty-seven per cent of countries (24 of 51) have comprehensive speed regulations that consist of a national urban speed limit of 50 km/h or less, with local authorities having permission to lower the limits. This covers 63% of the population of the European Region, as shown in Fig. 9. Enforcement, however, needs to be improved (Fig. 10). While 38 countries out of 51 (74%) have urban speed limits of 50 km/h or less, 13 countries still have an urban speed limit exceeding 50 km/h.
Speed limits should be reduced to 30 km/h in areas where vulnerable road users and cars mix, such as around schools and residential areas. It is therefore important to give local authorities the power to lower speed limits for such conditions. Almost half of the countries in the Region (45%), however, do not allow local authorities to lower national speed limits.
Enforcement of existing speed limits needs to be improved.

People who violate speed regulations face fines, licence withdrawal or demerit points in all the responding countries. Only 15 countries report that enforcement of their respective speed laws is effective (8 on a scale of 1–10); eight are HICs and seven LMICs. Social marketing campaigns can help to support enforcement and ensure respect for, and compliance with, speed limits (27). A combination of manual and automated enforcement methods can increase the probability of detecting violations (27). Almost all the participating countries (n = 50) reported conducting speed-enforcement activities, with many (n = 45) having a combination of manual and automated enforcement. While manual enforcement remains the dominant method of enforcement (49 countries), 46 countries indicated that they employ automated speed enforcement. Automatic enforcement (such as fixed-camera and mobile in-vehicle fitted devices) systems are highly cost–effective and can be adapted effectively to low-resource settings (28).

80% of drivers admitted to driving above the posted speed limits
SAFER ROAD USERS
LEGISLATION ON KEY BEHAVIOURAL RISK FACTORS

Enacting and enforcing comprehensive laws is an important way of improving road-user behaviour and is a critical component of safe systems to enhance safety on roads. There is a strong evidence base showing that laws addressing the key risk factors of speeding, drink–driving, and non-use of motorcycle helmets, seat belts and child restraints can reduce road-traffic deaths and injuries (12,17,26,29). To be effective, such laws need to be in line with best practice, stringently enforced and, together with standards and compliance regimes for the licensing and disqualification of drivers and riders, align with media campaigns (30). Detailed assessment of legislation coverage for major risk factors is provided in Table 1.

In addition to strategies with specific measurable targets, governments and parliaments have important roles in protecting road users by enacting and enforcing legislation on road safety. Forty countries with lead agencies on road safety report having periodic reviews of legislation, rules and standards against best practice and provide recommendations for improvement. The lead agencies in 39 countries have the ability to develop and/or revise legislation. Working definitions

</table>

*BAC: blood alcohol concentration.
of comprehensive laws on risk factors are described in Box 3. Evidence is clear on the risks of mobile phone use while driving and driving under the influence of drugs.

**Box 3. Criteria used to define comprehensive legislation for key behavioural risk factors**

**Speed**
- Presence of a national speed limit law that:
  - sets urban speed limits not exceeding 50 km/h (based on research, lower limits are recommended for urban areas and 30 km/h for residential areas and areas with high pedestrian activity); and
  - gives local authorities the power to reduce nationally set speed limits (to adapt to different contexts).

**Drink–driving**
- Presence of a national drink–driving law that sets the blood alcohol concentration (BAC) limit for the:
  - general population that does not exceed 0.05 g/dl
  - young and novice drivers that does not exceed 0.02 g/dl.

**Motorcycle helmets**
- Presence of a national motorcycle helmet law that:
  - applies to both drivers and passengers
  - applies to all road and engine types
  - specifies that helmets should be fastened
  - refers to/specifies a standard for helmets.

**Seat belts**
- Presence of a national seat-belt law that:
  - applies to front- and rear-seat occupants.

**Child restraints**
- Presence of a national child-restraint law that:
  - requires children to use a child restraint at least until 10 years of age or 135 cm in height;
  - restricts children under a certain age or height from sitting in the front seat; and
  - makes reference to or specifies a standard for child restraints.

These criteria are developed and utilized by WHO and reflect international evidence-based best practice. Further details of the criteria can be reviewed in the Global status report on road safety 2018 (12).
Only five countries in the Region have road-safety legislation that meets good practice. Enforcement of laws is essential to changing risk behaviours and needs to be improved.

Currently, 46 countries, representing over 850 million people, have laws that meet best practice for at least one of the five key behavioural risk factors. Across the Region, however, only five countries (France, Hungary, Italy, Luxembourg and Sweden) have good-practice legislation covering all five main risk factors: speed, drink-driving, motorcycle helmet use, seat-belt use and child restraints. This is a slight improvement from four countries in baseline in 2010 (3,4).

Globally, the Region has the highest number of countries with good-practice legislation covering many risk factors, yet with only 10% of countries currently having comprehensive road-safety legislation, the Region falls short of the objective of the Decade of Action for Road Safety, which aims for 50% of countries having comprehensive legislation for all five risk factors by 2020.

Despite the increasing enactment of laws relevant to road safety in the Region, reported enforcement is suboptimal. Enforcement of existing laws varies widely in the Region. Fig. 10 shows the number of countries with legislation for the five risk factors that meets good practice and is well enforced (that is, has a score of 8 or more on a scale of 1–10).

The ongoing Decade of Action for Road Safety and the voluntary targets provide important opportunities to prioritize the revision and enforcement of critical road-safety legislation. Laws enforced by traffic police should result in the administration of penalties commensurate with the severity of the offence. These range from driving license demerit or penalty points, to administrative fines, licence withdrawal, vehicle impoundment and even imprisonment. Risk behaviour is best modified if enforcement is coordinated with social marketing campaigns (17). Of the 45 countries with lead agencies to coordinate all road-safety activities, 32 also coordinate national mass media campaigns.
DRINK–DRIVING

Although all countries in the European Region have national laws to regulate drink–driving, only 28 are in line with best practice.

Alcohol is a major risk factor for road-traffic crashes. The risk for crashes starts to increase exponentially at a BAC of 0.04 g/dl (8). WHO recommends setting and enforcing national legislation with a drink–driving law based on a maximum BAC of 0.05 g/dl for the general population and 0.02 g/dl or less for novice and probationary drivers. Since the last legislative review for the third global status report on road safety, nine countries have changed their drink–driving laws to be in line with criteria for best practice, but seven have regressed from best practice (13,14). Nineteen countries do not have a lower limit for novice drivers, and four do not base their law on objective measures (such as BAC).

To be effective, enforcement of drink–driving laws needs to be supported by BAC testing, strict penalties and social marketing campaigns. Only 13 countries reported a high level of enforcement for drink–driving. More countries in LMICs (n = 8) rated effective enforcement than HICs (n = 5). Enforcement that incorporates random breath-testing strategies is more effective than targeting during certain times and in certain areas to increase the probability of being caught and to deter drinking and driving (31). Sixty-five per cent (n = 33) of countries in the WHO European Region use all-year-round random breath testing to enforce the laws, and 20% (n = 10) use breath testing in specific locations (such as pubs) or at specific times.

National estimates of the proportion of road-traffic deaths that are attributable to alcohol use are collected in 44 countries and range from less than 1% to 39%. The alcohol-attributable fraction (AAF) denotes the proportion of road-traffic deaths caused by alcohol. Data collected for the 2018 global status report on alcohol and health found that the prevalence of AAF on road-traffic deaths for the Region is 37.7% (32). Only 31 countries give police the authority to test BAC in drivers involved in fatal-injury crashes, though this may
not be practised routinely. Better and more complete data on BAC testing are needed in countries to estimate the potential of preventing drink–driving and reducing alcohol-related harm.

USE OF MOTORCYCLE HELMETS

Progress has been made in protecting motorcyclists, but many countries still have laws that do not meet best practice.

For every vehicle mile travelled in 2016, motorcyclists were nearly 28 times more likely to be killed in a crash than people in passenger cars (33). Standard-quality motorcycle helmets, when of good design and worn correctly, have been shown to reduce the risk of serious head injuries by 69% and risk of death by 40% (34). The proportion of motorcycle deaths of all traffic deaths in the WHO European Region decreased slightly from 11.6% to 11.1% between 2010 and 2016. All countries in the Region have laws in place that make helmet use compulsory for motorized two-wheelers, but only 19 have laws that
meet all criteria for best practice. Safety standards for helmets have not been adopted in 22 countries. In three, laws on helmet-wearing do not apply to all engine types, while in 19, the law does not stipulate that helmets need to be fastened properly. Since the 2015 legislative review, the Russian Federation has aligned its helmet laws in line with best practice (13,14).

Overall, 28 countries (55%) reported that the enforcement of helmet laws by police is effective (21 in HICs and seven in LMICs). Only 13 countries have legislation in line with best practice that is well enforced, representing 27% of the Region. Twenty-one countries collect data on the number of motorcycle riders that wear helmets. Fourteen of those that collect data found helmet-wearing rates at 90% or above; seven have lower helmet-wearing rates. In general, helmet-wearing rates were lower in passengers than in drivers.
USE OF SEAT BELTS

Forty-six countries have comprehensive laws on seat-belt use, covering 94% of the Region’s population.

Wearing a seat belt is one of the most effective life-saving interventions. It reduces the risk of a fatal injury by 45–50% for drivers and front-seat occupants and the risk of fatal and serious injuries for rear-seat occupants by 25% (8). Comprehensive laws on seat-belt use are those that cover both front- and rear-seat occupants in private cars (Fig. 11). Some countries apply exceptions; while a few may be justified, others put road users at unnecessary risk.

Fig. 11. Legislation on use of seat belts, by country
Rates of wearing seat belts are suboptimal in many countries, suggesting that enforcement needs to be improved.

Only 18 countries (35%) rate their enforcement as effective, suggesting that it needs to be improved. Most of these countries (13) are from HICs, while only five are from LMICs. Collecting data on the proportion of people wearing seat belts is essential to evaluating the effectiveness of enforcement and campaigns to promote wearing of seat belts. Such data are not available in 13 countries on front seat-belt use and 17 countries on rear seat-belt use (Table 2). For the 38 countries that measure seat-belt-wearing among front-seat occupants, the median reported usage was 91%. The median proportion of rear seat-belt use was 75% in the 34 countries that collect these data.

</table>

Use of child restraints in cars needs to be increased.

Forty countries (78%) have laws on the use of child restraints in cars based on age or height, representing 84% of the Region; almost all the responding countries (n = 50), however, have restrictions in place disallowing children from sitting in the front seat (Fig. 12).

When fitted correctly, child restraints can lead to at least a 60% reduction in deaths (35). Compared to the cost of purchasing a vehicle, the cost of a child restraint is negligible. Since the 2015 legislative review, Iceland and Romania have brought their child-restraint laws
in line with best practice (13,14). Despite many countries having national child-restraint legislation, only 16 reported a high level of enforcement. Of these, 13 are HICs and three LMICs.

Fig. 12. Legislation on car child restraint, by country

Source: WHO (12).

REDUCING DRUG-DRIVING

Almost all countries in the Region have national legislation against drug-driving, but enforcement capacity is limited.

Recognition of the problem of driving under the influence of drugs, especially if used in combination with alcohol, is growing (12). There are many complexities around testing and establishing the causality of different drugs to road-traffic crashes (36). In addition, evidence on the effectiveness of legislation to limit or prohibit drug-driving is insufficient to establish best-practice criteria.
All responding countries in the Region except for one (98%) have national laws against drug-driving. While in most countries these laws apply generally to legal and illegal drugs that impair driving, only 11 countries specify what these are. The technical aspects of drug detection at the roadside make enforcement of laws a challenge, especially for LMICs. Since the 2015 legislative review, Denmark, France, Ireland, Luxembourg and Ukraine have limited/banned the consumption of drugs while driving (13,14). Only 28 countries routinely test drivers involved in fatal crashes for drugs, representing 65% of the Region.

REDUCING DISTRACTED DRIVING

Most countries prohibit hand-held mobile phone use while driving.

Being distracted while driving significantly increases the risk of crashes. Mobile phone use is a major cause of distracted driving (37,38). Evidence is accumulating on the risk that mobile phone use poses to road safety. Talking on the phone while driving (hand-held or hands-free) increases the risk of being involved in a crash by four times; the risk is raised about 23 times for texting while driving (39).

Use of a mobile phone while driving is widespread among young and novice drivers, adding further to the already high risk of crash and death among these groups. There is insufficient evidence on the effectiveness of legislation to limit or prohibit the use of mobile devices while driving to establish best-practice criteria. Fifty countries (98%) prohibit hand-held phone use while driving. Evidence suggests that hands-free phones have no significant advantage over hand-held phones in terms of reducing the risk of crashes (12). Only four countries prohibit the use of hands-free phones while driving.

Countries are beginning to collect data on mobile phone use. Twenty-six regularly collect data, of which 16 do so as part of regular police crash reports and 10 through regular observational studies.
SAFER VEHICLES
SAFETY STANDARDS FOR VEHICLES

Safety standards for vehicles is an important pillar of the Decade of Action for Road Safety (2). The number of vehicles on the roads is increasing in the Region, especially in the eastern part. There is growing concern about whether these vehicles meet international vehicle-safety standards (12). Vehicle-safety standards mandate manufacturers to make vehicles that reduce the likelihood of crashes, protect car occupants from harm in the event of a crash and minimize damage to other road users, such as pedestrians. Eight of the United Nations safety standards for new cars7 set by the World Forum for Harmonization of Vehicle Regulations were prioritized to assess safety in this report (Box 4).

Box 4. Priority United Nations vehicle-safety standards

1–2. Frontal-impact protection and side-impact protection (R94 and R95): ensure that cars withstand the impacts of a frontal- and side-impact crash when tested at certain speeds. These crashworthiness regulations help to protect occupants withstand the impact of front- and side-impact crashes.

3. Electronic stability control (R140): prevents skidding and loss of control in cases of oversteering or understeering and is effective in reducing crashes and saving lives. It is also effective in avoiding single-car and roll-over crashes, reducing both fatal and serious injuries.

4. Pedestrian front protection (R127): provides softer bumpers and modifies the front ends of vehicles (by, for instance, removing unnecessarily rigid structures) that can reduce the severity of a pedestrian impact with a car.

5–6. Seat belts and seat-belt anchorages (R14 & R16): ensure that seat belts are fitted in vehicles when they are manufactured and assembled and that the seat-belt anchor points can withstand the impact incurred during a crash, to minimize the risk of belt slippage and ensure that passengers can safely be removed from their seats if there is a crash.

7. Child restraints (R129): ensure that the child seat is in place with adult seat belt and that ISOFIX child restraint anchorage points are fitted to secure the restraint.

8. Motorcycle anti-lock braking systems (ABS) (R78): help the rider maintain control during an emergency braking situation and reduce the likelihood of a road-traffic crash and subsequent injury.

Source: UNECE (40).

7 These include standards for frontal impact, side impact, electronic stability control, pedestrian protection, seat belts, seat-belt anchorages, child restraints and motorcycle anti-lock braking systems (12).
Thirty-one countries, representing over 520 million people, have implemented all eight priority United Nations vehicle-safety standards.

All EU and European Free Trade Association countries have applied the eight key safety standards for frontal impact, side impact, electronic stability control, pedestrian protection, seat belts, seat-belt anchorages, child restraints and motorcycle ABS. While the Russian Federation, San Marino and Turkey have applied seven standards and Israel six, the remaining 16 countries have not (Fig. 13). In countries (often LMICs) where such vehicle standards are not mandatory, vehicle manufacturers are not required to install technologies that have a proven safety benefit, resulting in inequitable access to safety. That said, vehicle fleets in many countries of the Region are composed of a significant proportion of used vehicles imported from EU and Asian countries, where priority safety standards are mandatory.

---

Fig. 13. Countries implementing priority United Nations safety standards for vehicles, 2018

---

8 The 16 countries that have not implemented the United Nations vehicle-safety standards are: Albania, Armenia, Azerbaijan, Bosnia and Herzegovina, Belarus, Georgia, Kazakhstan, Kyrgyzstan, North Macedonia, the Republic of Moldova, Montenegro, Serbia, Tajikistan, Turkmenistan, Ukraine and Uzbekistan.
While vehicle standards have been developed for car occupants, many are not widely implemented in vehicles sold in LMICs. Since the last review in 2015 for the third global status report on road safety (13,14), 35 countries have applied standards for frontal impact, side impact, electronic stability control, seat belts, seat-belt anchorages and child restraints. Thirty-four have implemented pedestrian protection and 31 countries have implemented motorcycle ABS.

To further improve car safety, the United Nations General Assembly recommends that Member States implement a new car assessment programme. These crash-testing programmes develop standardized star ratings for consumer information on crashworthiness and crash avoidance, as well as promoting vehicle-safety technologies for the protection of car occupants and external road users (41,42).
SAFER ROAD INFRASTRUCTURE AND MOBILITY

Only half of countries in the Region have conducted standardized assessments for safer road infrastructure.

Safer road infrastructure is another important goal of the Decade of Action for Road Safety (2) and is strongly linked to fatal and serious injury causation in road crashes. In the safe-system approach, the aim is to create a safe road environment, rather than just placing the main responsibility for safety on road users.

Road-safety assessments and star ratings can help identify deficiencies in road infrastructure. Assessments can be performed for new and existing roads. Forty-nine countries in the Region (96%) require full or partial safety reviews for the design and planning of new road infrastructure. All responding countries (n = 51) inspect existing infrastructure for safety on a regular basis through maintenance star-rating/safety-rating assessments (53%) and safety inspections (39%), and only four countries (8%) conduct formal road assessments for...
safety. Forty-one countries (80%) also have systematic programmes to target investment and upgrade high-risk locations, such as performing black-spot or black-length programme analyses (33 countries) and safe-system investment (18 countries) to make roads safer. Of these countries, 16 have programmes for both black-spot analyses and safe-system investment.

Assessments can be carried out through national or international road-assessment programmes such as the iRAP [8]; iRAP evaluates and assesses the level of protection against risk of death and serious injury in collisions on the roads using a star-rating system from one star (least safe roads) to five stars (safest roads).

Inclusive and active transport is a win–win strategy by making roads safer for vulnerable road users and the population healthier.

The health and development benefits of linkages between sustainable transport and road safety have been emphasized through the SDGs [5]. Physically active forms of transport such as walking and cycling have health benefits, as they counteract the likelihood of developing obesity and noncommunicable diseases [43]. Regular physical activity is also associated with reduced risk of heart disease and stroke and improved mental health and quality of life.

Dependence on motor-vehicle transport causes environmental damage due to air pollution, noise pollution and climate change. Motorized transport contributes to a range of gaseous air pollutants and suspended particulate matter. Exhaust emissions from motorized transport account for up to 30% of fine particles [44]. These fine particles and other air pollutants contribute to health-damaging effects such as respiratory illness, cardiovascular disease, cancer and decreased mental well-being, and increase the dangers of extreme weather events [26,45].

Thirty per cent of all road-traffic deaths in the Region occur among pedestrians and cyclists. Thirty-three countries in the Region have national policies that encourage walking and cycling, and a further seven have these at subnational level. Physically active transport
is encouraged by the WHO European physical activity strategy (43). Cycling is one of the activities included in the WHO global action plan on physical activity for 2018–2030 (46).

Road designs often prioritize motorized vehicle movement over the safety of pedestrians and cyclists. As a result, vulnerable groups are less protected than car occupants and may have no choice but to use unsafe road infrastructure. Efforts therefore need to go hand in hand with increasing the protection of pedestrians and cyclists to ensure that walking and cycling become safer.

The heavy burden of deaths borne by these road users is also a reflection on infrastructure. While 43 countries have national policies to protect pedestrians and cyclists by physically separating them from motorized traffic, eight have no policy in place for separating vulnerable road users from high-speed traffic. Besides promoting walking and cycling, countries should also promote public transport as alternatives to car travel. Forty-five countries have national policies to support investment in public transport, 13 more than in 2010 (3,4) (Fig. 14).

![Figure 14](image-url)
NATIONAL POLICY RESPONSE TO ROAD-TRAFFIC INJURIES AND DEATHS

Most countries in Europe have developed national strategies to improve road safety.

National road-safety strategies have been developed in 469 of the 51 countries that took part in the survey, suggesting that road safety is high on their policy agenda. Full funding for implementation of national strategies is available in only nine countries, with an additional 36 reporting partial funding. Given the complexity of, and cross-sectoral responsibility for, road safety, the presence of lead agencies tasked with overseeing and/or coordinating across government to improve road safety was reported in 45 countries, one fewer than in 2010.

National road-safety strategies or plans require the combined actions of many sectors. Lead agencies, as proposed by the Decade of Action for Road Safety (2) and the voluntary global performance targets for road-safety risk factors and service-delivery mechanisms (11), are best placed to coordinate actions.

National road-safety targets are a valuable tool for ensuring implementation of national road-safety strategies. Setting measurable, time-limited and realistic targets is important, but only 42 countries reported having measurable targets to reduce deaths and 29 the number of people seriously injured (Fig. 15). There are wide variations across the Region, with countries in the EU having more measurable targets to reduce deaths and serious injuries than countries in the CIS. Many countries also have specific targets to improve the risk factors of speed, drink–driving and use of seat belts, child restraints and helmets (Fig. 16).

5 Five countries did not have national road-safety strategies: Armenia, Azerbaijan, Switzerland, Ukraine and Uzbekistan.

42 countries reported having measurable targets to reduce deaths.
POST-CRASH RESPONSE: CARE AND TREATMENT OF INJURED PEOPLE

Post-crash response can save lives – many countries need to improve their emergency trauma services.

Efficient and high-quality emergency services can improve outcomes and survival after a crash (47). Some of the disparity in mortality rates in the Region may be attributable to better-quality post-crash response and emergency care in some countries resulting in improved survival, as has been reported from HICs (48,49). Rapid access to such care is critical. A Swedish study into survivability of fatal road-traffic crashes indicated that up to 32% of victims could have survived if there had been timely access to prehospital and emergency care (50). The European emergency number of 112 has been adopted in all 28 EU Member States, other European countries and elsewhere. Every country in the Region has a national emergency number. Thirty-eight have a universal nationwide emergency number of 112, while 13 have other numbers.

Health systems’ capacity in emergency trauma care needs to be strengthened.

Efficient emergency trauma care requires specially trained staff (49). Emergency medicine is recognized as a specialty for medical doctors in 43 countries – a slight improvement from 41 in 2010. Thirty-nine countries have postgraduate specialization courses for nurses in emergency care or trauma, three more than in 2010. The WHO basic emergency care course and trauma care checklist provide training for systematic approaches to management of acute and life-threatening conditions to frontline prehospital and facility-based providers (51,52).

Routine assessment of prehospital and facility-based emergency care systems is important to strengthen and build greater capacity to respond to emergencies (49). Seventeen countries had conducted
such assessments at national level at the time of the questionnaire. The WHO emergency care system framework is recommended for these routine assessments (53).

**Injury surveillance systems need to be improved and emergency room-based data collected.**

Data on road-traffic injuries are essential for monitoring progress towards national targets and evaluating prevention programmes and the quality of post-crash care (49). All 51 responding countries monitor road deaths, with most (n = 39) doing so through police databases; two countries monitor data through vital registration, and the remaining 10 through combinations of police, hospital and vital registration databases and others. Three use definitions that are shorter than the international standard of assessing death within 30 days of a crash\(^\text{10}\) and four have unlimited time periods following crashes. Forty-nine countries\(^\text{11}\) also have vital registration data, of which 46 have national estimates. **Box 5** provides an example of a real-time injury surveillance system to track road-traffic injury from the Ministry of Internal Affairs of the Russian Federation.

\(^{10}\) The 30-day definition of a road-crash death applies to a person who dies within 30 days of a crash on a public road involving a vehicle with an engine, the death being the result of the crash. Such data are collated by the authority responsible for road-crash data and usually are notified by the police.

\(^{11}\) Two countries did not have vital registration data: Romania and Uzbekistan.
WHO has developed guidelines for community- and facility-based injury surveillance and a standardized data set to facilitate clinical quality improvement and prevention activities (54).

Box 5. Case study from the Russian Federation: Real time road crash information system to monitor road-traffic injury and enhance road safety

In 2012, the Ministry of Internal Affairs of the Russian Federation established an automated electronic system for registration and analysis of data on all road-traffic crashes, injuries and deaths occurring from district level up to federal level.

The system ensures the availability of real-time information on more than 300 indicators for each road-traffic event. It is based on two key modules: the Road-traffic Accident Log is for entering all details about a road-traffic event; and an analysis module is used to perform all statistical computations relating to rates of crashes, injuries and deaths.

Primary information about each crash event are entered into the system within three hours of police attendance at the scene of the crash. The system largely is automated through links to the national databases of registered vehicles and licensed drivers. It records variables related to drivers and vehicles involved in a crash, including details of driving history and record of administrative sanctions.

The system uses an electronic map of the country, displaying the place of the crash event, black-spot and black-length road sections, and other information necessary to support crash investigations and appropriate management decision-making. Photographs from crash sites are also available. Information is shared with other government agencies to support similar actions related to the prevention of deaths and injuries.

Pre-populating the crash event record with autonomous variables helps to reduce the time of filling in the cards and increase the reliability and subsequent comparability of the processed data. The system maintains full user oversight of the completeness and reliability of the information entered both from regional and federal levels.

Variables on the number of crashes with killed/injured and the number of persons killed/injured in the crash are reported to the Federal State Statistics Service monthly. Internal police statistics also include other variables such as the total number of crashes, including those without any injuries.

Information on road-traffic crash events, as well as enforcement-related activities, is published monthly on the official website of the State Traffic Inspectorate. Online public users can browse summary indicators and crash registration, displaying de-identified information about the crash and causes and conditions that contributed to them. The online system can also inform the public if a second-hand vehicle they may be considering to purchase has previously been involved in a crash.

35% reduction in road-traffic crashes resulting in death or injury was seen in the Russian Federation between 2012 and 2018 (from 27 991 to 18 214), saving almost 10 000 lives
The indicators generated by the systems are used by various public authorities and serve to determine state policy in the field of road safety, and to prepare legislative normative acts regulating road-safety issues, among others.

The collected indicators and their analysis became the basis for the preparation and implementation of the federal target programme "Improving road safety, 2013–2020", the road-safety strategy in the Russian Federation for 2018–2024, the federal project "Road safety" and the national project "Safe and high-quality roads", implemented to solve the tasks defined by the decree of the President of the Russian Federation (of 7 May 2018) No. 204 “on national goals and strategic objectives for the development of the Russian Federation for the period up to 2024, as well as many other regulatory legal acts regulating road safety issues”.

As an interim result, road-traffic crashes resulting in death or injury reduced by 35% between 2012 and 2018 (from 27 991 to 18 214), saving almost 10 000 lives on the roads of the Russian Federation. This includes a 36.6 % reduction in pedestrian deaths (8127 to 5155) and a 33.2% reduction in road-traffic deaths of children (940 to 628).

Source: General Inspectorate for Road Safety of the Ministry of Internal Affairs of the Russian Federation.

Box 5 contd

The indicators generated by the systems are used by various public authorities and serve to determine state policy in the field of road safety, and to prepare legislative normative acts regulating road-safety issues, among others.
CONCLUSIONS
Every day, 221 people are killed due to road-traffic crashes, and many more are seriously injured. Road-traffic crashes are a major cause of injury and death in the WHO European Region and are the leading cause of death for children and young adults. They resulted in over 80 000 deaths in 2016.

While there has been a 13.4% reduction in deaths in the Region since the baseline measure in 2010 (1), this progress has not occurred at a sufficiently fast pace to compensate for rapid motorization. LMICs account for only 26% of the Region’s vehicles, but 70% of road-traffic deaths occur in these countries. Every four in 10 people killed on the road are pedestrians, cyclists or motorcyclists.

Should the fall in the number of deaths continue at its current pace, the SDG target to halve road-traffic deaths by 2020 will not be met. Yet the review of key risk factors shows promising progress being made across all five pillars of the safe-system approach on road-safety management, improving key road-safety laws, infrastructure, adoption of vehicle standards and improving access to post-crash care.

Compared to 2010, 40 countries have made progress in reducing the number of road-crash deaths, but six have seen an increase. While some countries in the Region have the lowest rates of road-traffic deaths in the world, large inequalities persist in the Region, ranging from 18.1 to 2.7 per 100 000 population. The commendable reductions in road-traffic fatalities have been the result of sustained efforts over a period of 50 years through implementation of the safe-system approach. Good practices and lessons learned from such an approach can be applied elsewhere in the Region (12,26).

If every country achieved the same lowest rate, more than 55 000 lives would be saved every year.

With road safety already identified as a priority by national governments and multilateral bodies, the focus must move beyond convincing decision-makers on the need to act. The key to achieving the goals of the Decade of Action for Road Safety 2011–2020 (2) and the SDGs (5) is whole-of-government implementation of data-driven and evidence-based strategies that have been shown to prevent road-traffic injuries and deaths, such as Save LIVES (55).

More than just token words are required. What is needed in countries is the political and technical commitment to implement the principles
and practices of a safe-systems approach to road safety which recognizes that the human body is highly vulnerable to injury and that humans make mistakes, but that complementary interventions to create safer roads, safer vehicles, safer speeds and safer behaviour by road users work together to accommodate error (8,9).

To tackle the global character of the road-safety challenge, the Stockholm Declaration (Annex 4) was presented as the outcome document for the Third Global Ministerial Conference on Road Safety, calling for greater international cooperation and partnerships across many sectors of society. The Declaration proposes an ambitious way forward and connects road safety to the implementation of the 2030 Agenda for Sustainable Development.

Recognizing the important role of cities and communities on road safety, the WHO European Healthy Cities Network and the WHO Regions for Health Network have issued a joint statement calling for action for safe mobility and transport for urban populations (Annex 5). The statement is aligned to and supplements the Stockholm Declaration.

As the leading cause of death of young adults, the Global Youth Statement for Road Safety (Annex 6) consolidated voices of more than 1500 young people from around the world to call for immediate action. The Statement calls for young people to commit to evidence-based solutions that save lives and act as role models for safe road behaviour.

The following actions, which are aligned with the 12 voluntary global performance targets for road-safety risk factors and service-delivery mechanisms, are proposed. Member States should:

→ implement the safe-system approach to road safety by incorporating all elements of the road-transport system and adopting shared responsibility and accountability between system designers and road users;

→ develop post-2020 national road-safety strategies with targets to reduce mortality and severe injuries due to crashes, and endow them with sufficient government funds to achieve road-safety objectives and set up financing and incentive models for regional and local levels – the development of these strategies needs to involve many sectors through establishing national advisory committees or lead agencies for road safety;
CONCLUSIONS

- improve and integrate injury-surveillance systems between hospital and police agencies to monitor progress towards reduction of fatal and non-fatal injuries, with better collection of injury data according to the MAIS+3 definition for severe road injury and standardization to allow for comparisons;
- change road-user risky behaviours using measures based on sound evaluation studies and, where applicable, consider cost–effectiveness;
- enact and enforce laws to change risky behaviours: while most countries (90%) have such laws, they need to be strengthened in many countries to bring them in line with best practice;
- increase the exchange of best practices in enforcement practices; social marketing campaigns would support better enforcement and acceptance of laws by the public;
- encourage participation of legislators in the global network for road-safety legislators and establish a regional network to share best practices and successful experiences in the Region as a strategy for stimulating the development and enforcement of effective road-safety legislation;
strengthen protection for pedestrians, cyclists and motorcyclists by making walking and cycling safer and providing public transport to encourage physically active and sustainable forms of transport;

support the adoption of international vehicle-safety standards to make cars safer on the roads: only 35 countries in the Region meet the priority safety standards assessed, and more need to implement the standards to prevent harm to all road users from crashes;

conduct formal road-safety assessments, especially in high-risk roads and around school and residential zones; and

provide greater investment to streamline the emergency response chain and improve the quality of trauma management within the health system to mitigate collision consequences.

The WHO Regional Office for Europe stands ready to support Member States in the implementation of Save LIVES and the above proposed actions.

COUNTRY PROFILES

The following 51 country profiles provide a national summary of key indicators for road safety. Most have been approved by ministries of health.

Data reported for population were extracted from the United Nations Population Division database (1), while gross national income (GNI) per capita for 2016 came from World Bank estimates (2).

The Bank Atlas method was used to categorize GNI into bands:

→ low income = US$ 1005 or less
→ middle income = US$ 1006–12 235
→ high income = US$ 12 236 or more.

### Vehicle standards applied (UNECE WP.29)

- Frontal impact standard: No
- Electronic stability control: No
- Pedestrian protection: No
- Motorcycle anti-lock braking system: No

## POST-CRASH CARE

- National speed limit law: Yes
- Max urban speed limit: 40 km/h
- Max rural speed limit: 80 km/h
- Max motorway speed limit: 110 km/h
- Local authorities can modify limits: Yes
- Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
- Predominant type of enforcement: Manual and automated

## DATA

- Reported road traffic fatalities (2016): 269 (81% M, 19% F)
- WHO estimated road traffic fatalities (2016): 399 (95% CI 369 - 428)
- WHO estimated rate per 100 000 population (2016): 13.6

## SAFER ROAD USERS

### National seat-belt law

- Applies to drivers and passengers: Yes
- Helmet fastening required: No
- Helmet standard referred to and/or specified: Yes
- Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
- % road traffic deaths involving alcohol: 5%

### National drink-driving law

- BAC limit – general population: ≤ 0.05 g/dl
- BAC limit – young or novice drivers: ≤ 0.05 g/dl
- Random breath testing carried out: Yes
- Testing carried out in case of fatal crash: Some drivers tested
- Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
- National motorcycle helmet law: Yes

### National child restraint law

- Children seated in front seat: Allowed in child restraint
- Child restraint required: Up to 4 yrs
- Child restraint standard referred to and/or specified: Yes
- Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10

### National law on mobile phone use while driving

- Ban on hand-held mobile phone use: Yes
- Ban on hands-free mobile phone use: No

### National drug-driving law

- Yes

INSTITUTIONAL FRAMEWORK

Lead agency: National Road Safety Council
Funded in national budget: Yes
National road safety strategy: No
Funding to implement strategy: —
Fatality reduction target: —

SAFER ROADS AND MOBILITY

Audits or star rating required for new road infrastructure: Yes
Design standards for the safety of pedestrians / cyclists: Partial
Inspections / star rating of existing roads: Yes
Investments to upgrade high risk locations: Yes
Policies & investment in urban public transport: Yes

SAFER VEHICLES

Total registered vehicles:
- Cars and 4-wheeled light vehicles —
- Motorized 2- and 3-wheelers —
- Heavy trucks —
- Buses —
- Other —
Vehicle standards applied (UNECE WP.29):
- Frontal impact standard: No
- Electronic stability control: No
- Pedestrian protection: No
- Motorcycle anti-lock braking system: No

POST-CRASH CARE

National emergency care access number: National, single number
Trauma registry: National
Formal certification for prehospital providers: Yes
National assessment of emergency care systems: No

DATA

Reported road traffic fatalities (2016): 267* (81% M, 19% F)
Reported rate per 100 000 population (2016): 9.1*
WHO estimated road traffic fatalities (2016): 461*
WHO estimated rate per 100 000 population (2016): 15.8*

* Annual statistics report, based on death compiled by provincial vital statistics authorities. Died within 30 days of crash

SAFER ROAD USERS

National speed limit law: Yes
Max urban speed limit: 90 km/h
Max rural speed limit: 90 km/h
Max motorway speed limit: 110 km/h
Local authorities can modify limits: No
Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
Predominant type of enforcement: Automated

National drink-driving law: Yes
BAC limit – general population: ≤ 0.04 g/dl
BAC limit – young or novice drivers: ≤ 0.04 g/dl
Random breath testing carried out: Yes
Testing carried out in case of fatal crash: All drivers tested
Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
% road traffic deaths involving alcohol: 2%*

National motorcycle helmet law: Yes
Applies to drivers and passengers: Yes
Helmet fastening required: Yes
Helmet standard referred to and/or specified: No
Children passengers on motorcycles: Prohibited under 12 yrs
Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
Helmet wearing rate: 95% Drivers*, 90% Passengers*

National seat-belt law: Yes
Applies to front and rear seat occupants: Yes
Self-reported enforcement: 0 1 2 3 4 5 6 7 8 9 10
Seat-belt wearing rate: 70% Drivers*, 70% Front seats*

National child restraint law: No
Children seated in front seat: Allowed in a child restraint
Child restraint required: —
Child restraint standard referred to and/or specified: —
Self-reported enforcement: —
% children using child restraints: —

National law on mobile phone use while driving: Yes
Ban on hand-held mobile phone use: Yes
Ban on hands-free mobile phone use: No
National drug-driving law: Yes

* The limit in residential area is reduced to 60 km/h
Legislative review conducted by WHO. Vehicle safety data from UNECE WP.29. Other data collected by questionnaire and cleared by Ministry of Health.
INSTITUTIONAL FRAMEWORK

Lead agency: BMVIT – Federal Ministry for Transport, Innovation and Technology

- Funded in national budget: Yes

\(^{a}\) Hungarian Central Statistical Office: Data collection No. 1009. Died within 30 days of crash.

In summary, Hungary has a strong institutional framework for road safety, with national road safety strategies in place and funding to implement these strategies partially. Audits or star ratings are required for new road infrastructure. However, investments in upgrading high-risk locations are lacking, and policies for urban public transport investments are not in place.

**SAFER ROAD USERS**

| National speed limit law | Yes |
| Max urban speed limit | 50 km/h |
| Max rural speed limit | 90 km/h |
| Max motorway speed limit | 130 km/h |
| Local authorities can modify limits | Yes |
| Self-reported enforcement | 012345678910 |
| Predominant type of enforcement | Manual and automated |

**National drink-driving law**

- BAC limit – general population: 0.00 g/dl
- BAC limit – young or novice drivers: 0.00 g/dl
- Random breath testing carried out: Yes\(^{d}\)
- Testing carried out in case of fatal crash: All drivers tested
- Self-reported enforcement: 012345678910
- % road traffic deaths involving alcohol: 7%\(^{e}\)

**National motorcycle helmet law**

- Applies to drivers and passengers: Yes
- Helmet fastening required: Yes
- Helmet standard referred to and/or specified: Yes
- Children passengers on motorcycles: Not restricted
- Self-reported enforcement: 012345678910
- Helmet wearing rate: 100% Budapest, 92% Country road\(^{f}\)

**National seat-belt law**

- Applies to front and rear seat occupants: Yes
- Self-reported enforcement: 012345678910
- Seat-belt wearing rate: 83% Front seats\(^{g}\), 39% Rear seats\(^{g,f}\)

**National child restraint law**

- Children seated in front seat: Allowed in a child restraint
- Child restraint required: 135–150 cm\(^{h}\)
- Child restraint standard referred to and/or specified: Yes
- Self-reported enforcement: 012345678910
- % children using child restraints: 67%\(^{i}\)

**National law on mobile phone use while driving**

- Ban on hand-held mobile phone use: Yes
- Ban on hands-free mobile phone use: No

**National drug-driving law**

| License type | Yes |

In summary, Hungary has strict laws for drink-driving, with zero tolerance for alcohol presence and random breath testing. However, there is a need for improvements in helmet laws and child restraint use.

**Deaths by road user category**

- Drivers and passengers of heavy trucks: 4%
- Drivers and passengers of 4-wheeled cars and light vehicles: 28%
- Pedestrians: 25%
- Cyclists: 12%
- Riders of motorized 2- and 3-wheelers: 11%
- Other: 2%

## INSTITUTIONAL FRAMEWORK

**Lead agency**
Republic Council on Road Traffic Safety and Coordination
Body of the Government of North Macedonia

Funded in national budget: Yes
National road safety strategy: Yes
Funding to implement strategy: Partially funded
Fatality reduction target: Reduction of fatalities to EU average, reduction of young driver victims by 30%, and zero child victims (2015 - 2020)

## SAFER ROADS AND MOBILITY

Audits or star rating required for new road infrastructure: Partial
Design standards for the safety of pedestrians / cyclists: Yes
Inspections / star rating of existing roads: Yes
Investments to upgrade high risk locations: No
Policies & investment in urban public transport: Yes

## SAFER VEHICLES

Total registered vehicles for 2015: 442,962
Cars and 4-wheeled light vehicles: 383,833
Motorized 2- and 3-wheelers: 10,050
Heavy trucks: 45,836
Buses: 3,243
Other: 0

Vehicle standards applied (UNECE WP.29):
- Frontal impact standard: No
- Electronic stability control: No
- Pedestrian protection: No
- Motorcycle anti-lock braking system: No

## POST-CRASH CARE

National emergency care access number: National, single number
Trauma registry: National
Formal certification for prehospital providers: Yes
National assessment of emergency care systems: Yes

## DATA

Reported road traffic fatalities (2015): 148 (80% M, 20% F)
Reported rate per 100,000 population (2015): 7.1
WHO estimated road traffic fatalities (2016): 134
WHO estimated rate per 100,000 population (2016): 6.4

* Ministry of Interior and State Statistical Office. Died within 30 days of crash
* WHO's method to obtain comparable country estimates: Group 1. Countries/areas with good death registration data. See explanatory note 3 in Global status report on road safety 2018 for full details

## SAFER ROAD USERS

**National speed limit law**: Yes
Mar urban speed limit: 50 km/h
Max rural speed limit: 90 km/h
Max motorway speed limit: 130 km/h
Local authorities can modify limits: No
Self-reported enforcement: 012345 78910
Predominant type of enforcement: Manual

**National drink-driving law**: Yes
BAC limit – general population: ≤ 0.05 g/dl
BAC limit – young or novice drivers: < 0.01 g/dl
Random breath testing carried out: Yes
Testing carried out in case of fatal crash: All drivers tested
Self-reported enforcement: 0123456 78910
% road traffic deaths involving alcohol: 1%

**National motorcycle helmet law**: Yes
Applies to drivers and passengers: Yes
Helmet fastening required: No
Helmet standard referred to and/or specified: No
Children passengers on motorcycles: Not restricted
Self-reported enforcement: 0123456 78910
Helmet wearing rate: —

**National seat-belt law**: Yes
Applies to front and rear seat occupants: Yes
Self-reported enforcement: 0123456 78910
Seat-belt wearing rate: 20% Front seats, 3% Rear seats

**National child restraint law**: Yes
Children seated in front seat: Prohibited under 12 yrs
Child restraint required: Up to 5 yrs
Child restraint standard referred to and/or specified: No
Self-reported enforcement: 0123456 78910
% children using child restraints: —

**National law on mobile phone use while driving**: Yes
Ban on hand-held mobile phone use: Yes
Ban on hands-free mobile phone use: Yes
National drug-driving law: Yes

* Can be increased up to 70 km/h
* In the law ≤ 0.009 g/dl
* 2015, Survey conducted by the Department for traffic and transport
* Except for children under 2 years in a rear-facing child restraint if airbag is deactivated

---

Deaths by road user category

- Drivers and passengers of heavy trucks: 3%
- Pedestrians: 33%
- Cyclists: 6%
- Riders of motorized 2- and 3-wheelers: 9%
- Passengers of 4-wheeled cars and light vehicles: 20%
- Drivers of 4-wheeled cars and light vehicles: 26%
- Other: 2%

Trends in reported road traffic deaths

Source: Information Technology, Data and Statistics Office
INSTITUTIONAL FRAMEWORK

Lead agency: Coordination Body for Road Traffic Safety
National road safety strategy: Yes
Funding to implement strategy: Partially funded
Fatality reduction target: 50% (2011-2020)

SAFER ROADS AND MOBILITY

Audits or star rating required for new road infrastructure: No
Design standards for the safety of pedestrians / cyclists: Yes
Inspections / star rating of existing roads: No
Investments to upgrade high risk locations: Yes
Policies & investment in urban public transport: Yes

SAFER VEHICLES

Total registered vehicles for 2016: 2,282,401
Cars and 4-wheeled light vehicles: 1,908,449
Motorized 2- and 3-wheelers: 63,587
Heavy trucks: 208,925
Buses: 9,709
Other: 91,731

Vehicle standards applied (UNECE WP.29):
Frontal impact standard: No
Electronic stability control: No
Pedestrian protection: No
Motorcycle anti-lock braking system: No

POST-CRASH CARE

National emergency care access number: National, multiple numbers
Trauma registry: Some facilities
Formal certification for prehospital providers: Yes
National assessment of emergency care systems: Yes

DATA

Reported road traffic fatalities (2016): 607* (82% M, 18% F)
Reported rate per 100,000 population (2016): 8.6*
WHO estimated road traffic fatalities (2016): 649*
WHO estimated rate per 100,000 population (2016): 7.4*

* Database of the Ministry of Interior on road traffic accidents. Died within 30 days of crash.
† WHO’s method to obtain comparable country estimates: Group 1. Countries/areas with good death registration data. See explanatory note 3 in Global status report on road safety 2018 for full details.

Deaths by road user category

Drivers and passengers of buses: 1%
Drivers and passengers of heavy trucks: 4%
Pedestrians: 23%
Cyclists: 9%
Riders of motorized 2- and 3-wheelers: 5%
Drivers of 4-wheeled cars and light vehicles: 30%
Passengers of 4-wheeled cars and light vehicles: 16%
Other: 7%

*Questionnaire completed by Horst Schulzes.
ANNEX 2
METHODOLOGY

A rigorous methodology for data collection was used (Fig. A2.1). This involved systematically gathering data and other information from each responding country in a four-phase process, primarily led by a government-appointed national data coordinator.

Fig. A2.1. Flow chart of methodology used for data collection and validation

- NDC* nominated by their government
- NDC participates in online regional training
- NDC works with WHO Regional Office to develop detailed workplan with clear timeline and deliverables
- In collaboration with Regional Data Coordinator, NDC identifies 6–8 road-safety experts (officially nominated by required sectors) to be questionnaire respondents
- All identified respondents are sent the questionnaire and an invitation to a consensus meeting
- Prior to the meeting, respondents fill in their copies of the questionnaire and bring them to the consensus meeting
- Consensus meeting held; NDC and respondents agree upon responses that best reflect their country situation – these answers are used to complete the single FINAL country questionnaire
- NDC works with WHO staff (initially with Country Office and Regional Office staff, then with WHO headquarters) to, for instance, validate the information submitted and resolve any inconsistencies
- NDC compiles full copies of all national road-safety legislation covering all seven risk factors
- Relevant legislative documents submitted to WHO
- WHO conducts the legislative review and extracts the relevant information on laws
- WHO sends NDC a sign-off sheet that summarizes the country data (note, this includes summary of legislative data)
- NDC facilitates the clearance of data in the sign-off sheet by the relevant ministry/ministries
- Government approves the data in the sign-off sheet for publication
- NDC uploads the questionnaire information into an online database
- NDC facilitates translation of questionnaire if needed
- Prior to the meeting, the NDC fills in his/her copy of the questionnaire

* NDC: national data coordinator/s.
First, a self-administered questionnaire was completed in each country by respondents from ministries including health, transport, police, national highway agency, emergency care, education, interior, national statistics office and, where relevant, nongovernmental organizations. Secondly, respondents were encouraged to hold a consensus meeting and agree on the data that best represented their country. Thirdly, WHO headquarters and regional technical staff validated the final data submitted for each responding country by checking them against independent databases and other sources. Lastly, approval to include the final data in this report was obtained from the national data coordinator and/or government officials.

Some data presented in this report were obtained from the WHO Global Health Estimates (1): this is clearly stated where applicable.

The questionnaire covered the following areas, which included indicators such as:

- the existence of a lead agency for road safety;
- national strategies and targets relating to reductions in road-traffic deaths;
- data on the magnitude of the road-traffic injury problem;
- policy and practices on infrastructure;
- legislation and enforcement on a number of key risk factors – speed, drink–driving and seat-belt and helmet use; and
- services to address the post-crash situation.

This report presents data from 51 countries that participated in the survey out of a total of 53 countries of the WHO European Region. National counterparts from Andorra and Monaco were not able to participate in the survey. Subanalyses by country income and subregional grouping are offered to identify inequalities in the Region. Analyses by income level include 30 high-income countries and 21 low- and middle-income countries, as defined by the World Bank (2). Analyses by subregion include 28 European Union countries and the 11 countries comprising the Commonwealth of Independent States. Together, these countries represent almost 100% of the Region’s 916 million people. Progress in the Region is also analysed against results from 48 Member States in the base survey conducted in 2013.

ANNEX 3

ESTIMATION OF TOTAL ROAD-TRAFFIC DEATHS

INTRODUCTION
This annex gives an overview of the methodology used to generate WHO estimates of road-traffic deaths in 2016 for all Member States of the WHO European Region. The estimates for the 51 countries that participated in the questionnaire and the methodological approach for each country are summarized in Table A3.1.

Countries were categorized in four groups, based on the completeness of capture and classification by cause of deaths in national vital registration systems. Table A3.2 provides an overview of the country grouping. The estimation methodology for each group is described in detail below.

### APPROACHES TO ESTIMATION

**Group 1. Countries with death registration data**

This group includes 45 countries with death registration data that meet the following completeness criteria: completeness for the year estimated at 80% or more; or average completeness for the decade, including the country-year, was 80% or more. Total road-traffic deaths were calculated from the death registration data and population data reported to WHO as follows.

Injury deaths classified as “undetermined intent” were redistributed pro rata across all unintentional and intentional injury categories within age–sex groups. These data were used to compute age–sex-specific death rates for road-traffic deaths. Where completeness was assessed at less than 100%, death rates were adjusted for incompleteness by multiplying by \((100/\text{completeness}\%)\). These death rates were applied to the United Nations estimates of population by five-year age group and sex (1) to estimate total road-traffic deaths for each country-year.
These countries fall into three further categories.

1.1 Countries with death registration data for year 2016 where the estimated road-traffic deaths for 2016 exceeded the number reported from the surveillance system. The death registration-based estimate is used. This category contains three countries (Armenia, Iceland and the Republic of Moldova).

1.2 Countries where the latest death registration data submitted to WHO are earlier than 2015 but not earlier than 2007. Deaths in year 2016 were estimated based on a projection of the most recent death registration data using the trends in reported surveillance data: this category contains 28 countries (Austria, Belarus, Croatia, Cyprus, Denmark, Estonia, Germany, Greece, Hungary, Italy, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Malta, Norway, Poland, Portugal, Romania, the Russian Federation, Serbia, Slovakia, Spain, Sweden, Ukraine, the United Kingdom and Uzbekistan).

1.3 Countries where the reported number of road-traffic deaths adjusted to unlimited time for 2016 exceeded the estimate based on death registration data. For 15 countries, the reported road-traffic deaths were used for year 2016 (Azerbaijan, Belgium, Bulgaria, Czechia, Finland, France, Georgia, Ireland, Israel, Luxembourg, Montenegro, the Netherlands, North Macedonia, Slovenia, Switzerland and Turkey).

Group 2. Countries with other sources of information on causes of death

In the WHO European Region, no countries fall under this grouping. For countries in other WHO regions that fall into this group, the regression method described below was used to project forward from the most recent year for which an estimate of total road-traffic deaths was available.

Group 3. Countries with populations less than 150 000

Regression estimates were not used for countries with populations less than 150 000 and which did not have eligible death registration data. The reported deaths were used directly without adjustment. This category contains one country (San Marino).

Group 4. Countries without eligible death registration data

For four countries (Albania, Bosnia and Herzegovina, Tajikistan and Ukraine) without death registration data at least 80% complete and with populations greater than 150 000, a regression model was used to estimate total road-traffic deaths. As for the first report, a negative binomial regression model, appropriate for modeling non-negative integer count data (number of road-traffic deaths) (2,3), was used. A likelihood ratio test was used to assess that the negative binomial model provided a better fit to the data than a Poisson model (where the variance of the data is constrained to equal the mean):

\[
(1) \ln N = C + \beta_1 X_1 + \beta_2 X_2 + \ldots + \beta_n X_n + \ln \text{Pop} + \varepsilon
\]

where \(N\) is the total road-traffic deaths (for a country-year), \(C\) is a constant term, \(X_i\) are a set of explanatory covariates, \(\text{Pop}\) is the population for the country-year, and \(\varepsilon\) is the negative binomial error term. Population was used as exposure, making it possible to interpret the coefficients (\(\beta_i\)) for the independent variables as effects on rates rather than a count. In a previous study, this type of model was used to represent
“accident proneness” (4). Karlaftis & Tarko (5) have also found a negative binomial regression model to be appropriate for counting data such as road-traffic fatalities.

The parameters $\beta_1, \beta_2, \beta_3 \ldots \beta_n$ (equation 1) were estimated by fitting the negative binomial regression model to estimated total road-traffic deaths for all country-years in the range 2000–2016 meeting the completeness criteria. By using the number of road-traffic deaths from countries from group 1 described above, we chose three models (Models A, B and C) that had good in-sample- and out-of-sample fit, and for which all the covariates were statistically significant and overall estimation is the average of the prediction of these three best models. See Table A3.3 for a detailed description of the covariates used for the regression model.

ANNEX 4

THE STOCKHOLM DECLARATION
Stockholm Declaration
Third Global Ministerial Conference on Road Safety: Achieving Global Goals 2030
Stockholm, 19–20 February 2020

We, Ministers and Heads of Delegations as well as representatives of international, regional and sub-regional governmental and nongovernmental organizations and the private sector gathered in Stockholm, Sweden, on 19 and 20 February 2020 for the Third Global Ministerial Conference on Road Safety;

Acknowledge the leadership of the Government of Sweden in preparing and hosting this Third Global Ministerial Conference on Road Safety;

Comment the Government of the Russian Federation for hosting the First Global Ministerial Conference on Road Safety in 2009, which culminated in the Moscow Declaration, and the Government of Brazil for hosting the Second Global High-level Conference on Road Safety in 2015, which culminated in the Brasilia Declaration;

Acknowledge the role of the Governments of the Russian Federation and the Sultanate of Oman in leading the process for adoption of related United Nations General Assembly resolutions;

Recognize the right of every individual to the enjoyment of the highest attainable standard of health;

Reaffirm the importance of intensifying international cooperation and multilateralism in achieving health-related Sustainable Development Goals, with particular focus on achieving global road safety targets;

Welcome United Nations General Assembly resolution 70/1 of 25 September 2015, entitled “Transforming our world: the 2030 Agenda for Sustainable Development”, and the Sustainable Development Goals (SDGs) as a framework to integrate road safety in other policy areas, especially policy areas relating to SDG targets for Climate Action, Gender Equality, Health and Well-Being, Quality Education, Reduced Inequalities, Sustainable Cities and Communities, Infrastructure and Responsible Consumption and Production for mutual benefits for all;

Welcome the adoption on 10 October 2019 of the United Nations High-level Political Forum on Sustainable Development’s political declaration and its pledge in September 2019, to make the coming decade one of action and delivery, and the continued commitment to maintain the integrity of the 2030 Agenda, including by “ensuring ambitious and continuous action on the targets of the SDGs with a 2020 timeline”, including target 3.6 of reducing road traffic fatalities and injuries by half;

Welcome the adoption of sub-national, national and regional road safety strategies, targets and action plans such as those already adopted by the Central Asia Regional Economic Cooperation (CAREC) and the European Union (EU) to meet the target to halve road deaths and serious injuries by 2030; and recognize the importance of regional initiatives to mobilize multi-sector road safety partnerships;

Welcome and encourage monitoring and reporting of progress towards the achievement of Road Safety goals, such as the Voluntary Global Road Safety Performance Targets agreed by United Nations Member States;

Welcome key achievements to date of the Decade of Action for Road Safety 2011–2020, including enhanced global coordination through the World Health Organization, the United Nations Regional Commissions and the United Nations Road Safety Collaboration, increased accession and implementation of the United Nations legal instruments on road safety, greater civil society engagement, production and dissemination of information resources on road traffic injury prevention including the WHO Global Status Reports on Road Safety, inclusion of road safety targets in the

1 https://undocs.org/en/A/HLPF/2019/l.1
SDGs, the establishment of the United Nations Road Safety Fund by support of the United Nations Secretary-General, the appointment and efforts of the United Nations Secretary-General’s Special Envoy for Road Safety in effectively mobilizing sustained high-level commitment to road safety, the increased commitment of the World Bank and other MDBs to road safety, increased focus and resources for road safety by many governments and the private sector including through donations to the Global Road Safety Facility and the Global Road Safety Partnership;

*Acknowledged* the lessons learnt from the Decade of Action for Road Safety 2011–2020 such as the need to promote an integrated approach to road safety such as a safe system approach and Vision Zero, pursue long-term and sustainable safety solutions, and strengthen national inter-sectoral collaboration including engagement with NGOs and civil society as well as businesses and industry which contribute to and influence the social and economic development of countries;

*Commended* the progress made but emphasize that **all countries** still face major challenges and whilst there are specific regional and local challenges there are also many proven measures that need to be intensified everywhere;

*Recognized* and work together to share experiences on adoption and enforcement of legislation on behavioral risks such as speeding, drinking and driving and failing to use seat-belts, child restraints and motorcycle helmets and implementation of proven measures to mitigate such risks, which could save hundreds of thousands of lives annually, but are still not being addressed in most countries;

*Expressed* great concern that road traffic crashes kill more than 1.35 million people every year, with over 90% of these casualties occurring in low- and middle-income countries, that these collisions are the leading cause of death for children and young adults aged 5–29 years, and that the projected up to 500 million road traffic deaths and injuries worldwide between 2020 and 2030 constitute a preventable epidemic and crisis that to avoid will require more significant political commitment, leadership and greater action at all levels in the next decade;

*Acknowledged* the significant impact of road traffic crashes on children and youth and emphasize the importance of taking into account their needs and those of other vulnerable populations including older people and persons with disabilities;

*Called attention to* the damaging impact of road crashes and related deaths and injuries on long-term national economic growth, the unequal progress across regions and income levels and express concern over the fact that no low-income countries have reduced the number of road traffic deaths between 2013 and 2016 which highlights clearly the link between development and road safety;

*Acknowledged* that the overwhelming majority of road traffic deaths and injuries are preventable and that they remain a major development and public health problem that has broad social and economic consequences which, if unaddressed, will affect progress towards the achievement of the SDGs;

*Recognized* the distinct and divergent challenges posed for road safety and sustainability in both urban and rural areas and note in particular the growing safety threat for vulnerable road users in cities;

*Stressed* the centrality to effective, evidence-based policymaking of gathering quality data, including at the regional level, notably on deaths and serious injuries;

*Recognized* that advanced vehicle safety technologies are among the most effective of all automotive safety devices;

*Recognized our shared responsibility* between system designers and road users to move towards a world free from road traffic fatalities and serious injuries and that addressing road safety demands multi-stakeholder collaboration among the public and private sectors, academia, professional organizations, nongovernmental organizations and the media;
Recognize that SDG target 3.6 will not be met by 2020 and that significant progress can only be achieved through stronger national leadership, global cooperation, implementation of evidence-based strategies and engagement with all relevant actors including the private sector, as well as additional innovative approaches.

Reiterating our strong commitment to achieving global goals by 2030 and emphasizing our shared responsibility, we hereby resolve to;

1. Reaffirm our commitment to the full implementation of the 2030 Agenda, recognizing the synergies between the SDG policy areas, as well as the need to work in an integrated manner for mutual benefits;

2. Address the connections between road safety, mental and physical health, development, education, equity, gender equality, sustainable cities, environment and climate change, as well as the social determinants of safety and the interdependence between the different SDGs, recalling that the SDGs and targets are integrated and indivisible;

3. Call upon Member States to contribute to reducing road traffic deaths by at least 50% from 2020 to 2030 in line with the United Nations High-Level Political Forum on Sustainable Development’s pledge to continue action on the road safety related SDG targets, including 3.6 after 2020, and to set targets to reduce fatalities and serious injuries, in line with this commitment, for all groups of road users and especially vulnerable road users such as pedestrians, cyclists and motorcyclists and users of public transport;

4. Call upon Member States and the international community to address the unacceptable burden of road traffic injury on children and young people as a priority, increasing political commitment, by ensuring that the Global Strategy for Women’s, Children’s and Adolescents’ Health delivers necessary action on road safety;

5. Ensure political commitment and responsibility at the highest level and establish regional, national and sub-national strategies and action plans for road safety and contributions from different governmental agencies as well as multi-sectoral partnerships to deliver the scale of efforts required at regional, national and sub-national levels to achieve SDG targets, and that these strategies and efforts are transparent and public;

6. Encourage Member States that have not yet done so to consider becoming contracting parties to the United Nations legal instruments on road safety as well as applying, implementing and promoting their provisions or safety regulations, and ensure that legislation and standards for road design and construction, vehicles, and road use are consistent with safe system principles and are enforced;

7. Include road safety and a safe system approach as an integral element of land use, street design, transport system planning and governance, especially for vulnerable road users and in urban areas, by strengthening institutional capacity with regard to road safety laws and law enforcement, vehicle safety, infrastructure improvements, public transport, post-crash care, and data;

8. Speed up the shift toward safer, cleaner, more energy efficient and affordable modes of transport and promote higher levels of physical activity such as walking and cycling as well as integrating these modes with the use of public transport to achieve sustainability;

9. Encourage and incentivize the development, application and deployment of existing and future technologies and other innovations to improve accessibility and all aspects of road safety from crash prevention to emergency response and trauma care, with special attention given to the safety needs of those road users who are the most vulnerable including pedestrians, cyclists, motorcyclists and users of public transport;
10. Ensure timely access to high quality emergency and long-term health care services for the injured and recognize that an effective post-crash response includes also mental, social and legal support for victims, survivors and families;

11. Focus on speed management, including the strengthening of law enforcement to prevent speeding and mandate a maximum road travel speed of 30 km/h in areas where vulnerable road users and vehicles mix in a frequent and planned manner, except where strong evidence exists that higher speeds are safe, noting that efforts to reduce speed in general will have a beneficial impact on air quality and climate change as well as being vital to reduce road traffic deaths and injuries;

12. Ensure that all vehicles produced and sold for every market by 2030 are equipped with appropriate levels of safety performance, and that incentives for use of vehicles with enhanced safety performance are provided where possible;

13. Ensure that an integrated road safety approach and minimum safety performance standards for all road users are a key requirement in road infrastructure improvements and investments;

14. Call upon businesses and industries of all sizes and sectors to contribute to the attainment of the road safety related SDGs by applying safe system principles to their entire value chain including internal practices throughout their procurement, production and distribution process, and to include reporting of safety performance in their sustainability reports;

15. Call upon public organisations at all levels to procure safe and sustainable transport services and vehicles and encourage the private sector to follow this example, including the purchase of safe and sustainable vehicle fleets;

16. Encourage increased investment in road safety, recognizing the high rates of return of road injury prevention projects and programs and the necessity of scaling up activities to meet the road safety related SDGs;

17. Emphasize the importance of monitoring and reporting progress towards the achievement of our common goals and, as appropriate, the Voluntary Global Road Safety Performance Targets agreed by Member States, and call upon the World Health Organization to continue to collect, publish and disseminate data through the series of Global Status Reports on Road Safety, leveraging as appropriate existing efforts including those of regional road safety observatories to harmonize and make road safety data available and comparable;

18. Call upon the World Health Organization to prepare an inventory of proven strategies and initiatives from a wide variety of member countries that have successfully reduced fatalities in member countries. A report should be readied for publication in 2024.

We call for a first High-Level Meeting of the United Nations General Assembly on Road Safety at the level of Heads of State and government to mobilize adequate national leadership and advance international and multisectoral collaboration in all the areas covered by this Declaration to deliver a 50% reduction in deaths and injuries over the next decade on our way to Vision Zero by 2050; and

We invite the United Nations General Assembly to endorse the content of this declaration.
ANNEX 5

STATEMENT OF THE WHO EUROPEAN HEALTHY CITIES NETWORK AND THE WHO REGIONS FOR HEALTH NETWORK
Statement of the WHO European Healthy Cities Network and WHO Regions for Health Network agreed at a meeting on urban road safety, satellite to the 3rd Global Ministerial Conference on Road Safety – Achieving Global Goals 2030

1. We, the cities and national networks of the WHO European Healthy Cities Network, and the regions of the WHO Regions for Health Network, fully support the Stockholm Declaration on Road Safety and recognize the vital role that cities play in creating safe urban environments and in remaining at the forefront of global, regional and local agendas affecting well-being for future generations.

2. We recognize that 75% of the 900 million people living in the WHO European Region live in cities, municipalities and urban centres.

3. We note that 70% of the people dying from road crashes on urban roads in the European Union are pedestrians, cyclists and motorcyclists, the most vulnerable road users.

4. We believe that safety is required for us to be healthy on our roads and in our communities, schools and homes.

5. We recognize that injuries and deaths from road crashes are not “accidents”. Scaling up our efforts to save lives requires that our language reflect the fact that injuries and deaths from road crashes can be prevented.

6. We therefore define road safety as a public health issue but also a key challenge for and determinant of sustainable mobility, transport, justice and social and economic development.

7. We believe that road safety can unlock the human potential of our urban streets, making them a resource for active mobility, further promoting public health and well-being.

8. We believe that through their urban planning, cities and municipalities should ensure that how they plan for motorized transport does not compromise the safety and active mobility of their residents.

9. We understand that focusing both political and technical attention on road safety is critical now, as is taking action to address the underlying social, cultural, economic and environmental factors that influence the road safety of urban populations.
10. We stress, as the levels of government closest to people and communities, that we are key actors in supporting the implementation of global and regional frameworks, and we are obligated to accelerate progress to improve road safety through participatory approaches throughout our policy and strategy planning.

11. We believe that achieving road safety requires engaging our populations in the decisions that affect them and that our close relationships with local communities put us at the forefront of implementation.

12. We recognize that progress in road safety varies highly within and between countries, regions and cities and that, by striving for progress in road safety locally, we will contribute to broader national and international efforts to create a safer WHO European Region and, by extension through collaboration and sharing experiences, a safer world.

13. We emphasize the leading roles of municipalities, cities and regions as advocates for public health, ensuring that the focus on evidence-informed and data-driven action withstands fluctuating social, cultural and political changes.

14. We recognize that the complexity behind the causes of injuries and deaths from road crashes requires a multidisciplinary and intersectoral response and makes victim blaming especially cruel to grieving loved ones and an ineffective and unacceptable approach.

15. We note that WHO and other road safety organizations recommend adopting the Safe System Approach to road safety. A safe system recognizes that the human body is highly vulnerable to injury and that people make mistakes but that complementary interventions to create safer roads, safer vehicles, safer speeds and safer behaviour by road users can work together to compensate for the mistakes and prevent inevitable crashes from resulting in injuries or death.

16. We reiterate that the recommended safe system approach to road safety is not under the jurisdiction of a single entity but that successful road safety outcomes require coordinated, collaborative and multilevel governance, political will, leadership and action.

17. We reiterate, that although global and regional frameworks and agendas provide the policy context and framing for improving road safety, we can work at the regional, municipal and city levels to ensure that no individuals are left behind regardless of their sex, race, religious beliefs, migration status, ethnicity, sexual orientation, age, political orientation, disability or socioeconomic circumstances.

18. We stress the importance of ensuring that road safety be considered throughout the policy process in cities and regions, from planning through implementation; otherwise actions in one
area can worsen road safety or increase challenges to it in other areas. This is especially pertinent in such areas as urban roads and infrastructure, open green space, public transport, active transport and modal shift in transport.

19. We commit to leading by example in implementing evidence-informed and data-driven strategies, including those for example recommended by WHO’s Save LIVES technical package, by POLIS and EUROCITIES in their New Paradigm for Safe City Streets and by the World Resources Institute.

20. We recognize that reducing speed in urban areas, both by enforced limits and by infrastructure design, is the most rapid and effective way to reduce deaths and injuries from road crashes.

21. We acknowledge that making urban streets safe requires significant investment, much more than can be sourced from city budgets. We need financial and technical support from our national governments.

22. We are fully aware that monitoring is key to accelerating progress towards improving road safety in the European Region. We commit to strengthening our local observatory and monitoring capacity, to showing progress towards and identifying challenges to achieving Sustainable Development Goal target 3.6 and to sharing information with all relevant stakeholders to ensure that findings are acted on.

23. We know that building safe, sustainable and resilient communities needs to be at the heart of strategies for accelerating progress towards public health and prosperity for all. We also know that action is required at the regional and city levels to achieve safe and resilient communities. We commit to being key partners in this process.

24. We commit to using and building on existing partnerships at the regional and city levels to accelerate progress towards improving road safety and commit to using the WHO European Healthy Cities Network and the Regions for Health Network as platforms for networking and partnering with relevant actors across society and multilevel government, ensuring an intersectoral approach to promoting public health diplomacy and policy coherence.

25. We commit to building capacity across all sectors of local government to equip them with the skills, tools and knowledge to develop policy that provides the framework for national, regional and local action to prevent deaths and injuries from road crashes and to develop appropriate indicators that measure progress.
26. We recognize and commit to achieving road safety in our local communities. We also call on our national governments, WHO, United Nations partners and the global community to simultaneously take urgent action on this global problem.

27. We, the WHO European Healthy Cities Network and the WHO Regions for Health Network, adopt this Declaration. We commit to taking forward this agenda in the spirit of the 3rd Global Ministerial Conference on Road Safety, held on 19–20 February 2020 in Stockholm, Sweden, and for it to serve as an impetus for enhancing and sustaining further engagement, collaboration and action on road safety in all our regions, cities and countries.

Now is the time to act. We cannot afford to fail.
ANNEX 6
GLOBAL YOUTH STATEMENT FOR ROAD SAFETY
We, the Youth of the World, gathering in Stockholm, Sweden for the 2nd World Youth Assembly for Road Safety, unite and say “no more!” to dying and getting injured on world’s roads. We were born into a global crisis: road traffic crashes have been the biggest killer of young people aged 15-29 for more than a decade. We are done with over 1000 young people dying every day. Why is the world not panicking? Wake up!

We, the Youth have been seen as ‘problematic road users’ – as the group in society that is reckless, takes risks and overestimates their capabilities. Why then are young people more likely to die in low- and middle-income countries than in high-income countries? It is the unsafe mobility system that is failing us. Stop blaming us, start protecting and engaging us.

This Global Youth Statement brings together the voices of more than 1500 young people who took part in Youth Consultations. It paints a vivid picture of what we experience every day on our unsafe roads. We, the Youth, representing over 74 countries proclaim ‘hear our voice’ and our call for immediate action. Not tomorrow, today.

We, the Youth of Africa, are forced to deal with **badly designed road infrastructure**, leading pedestrians to jaywalk and vehicles to get involved in serious crashes. A lack of basic **education and awareness**, causes people to drive without proper training. The air pollution caused by unroadworthy vehicles is making us suffocate.

We, the **Youth of the Americas**, experience **poverty** leading to poor public services. Many of the victims could have been saved if post-crash services were more efficient or adequate facilities even existed. Also, public insecurity and sexual harassment are major concerns that prevent women from using public transport.

We, the **Youth of South-East Asia**, and of the **Western Pacific**, are fed up of corruption leading to **poor regulation and enforcement**. Pedestrians get forced out of the sidewalk by vendors and vehicles. We see overcrowded and speeding public vehicles, simply because drivers want to earn more. And still, not enough people are wearing helmets on two-wheelers.

We, the **Youth of the Eastern Mediterranean**, can’t **access safe and sustainable transportation**. Wheelchair users in particular, are required to wait hours for a bus, due to the lack of disability-friendly systems across the region.

We, the **Youth of Europe**, need better infrastructure for cyclists and pedestrians, as well as **safer road users**. Problems like drunk/drug-driving still exist and mobile phone use behind the wheel has become a pressing modern-day issue for all road users.

These challenges affect us all in the same way, no matter where we are.
We cannot trust that our decision-makers will make the right decisions. We are therefore claiming our space at the decision-making table. **We, the Youth of the World, demand:**

- **Rape that do not kill our dreams:** protect vulnerable users, children and youth on their way to get an education. Stop funding and building anything less than 3-star roads.
- **Education for every road user:** so that we can afford formal and graduated driving training, the necessary safety equipment and information on how to be safer.
- **"Slow down!":** speed kills; we need established and enforced safe speed limits appropriate to the function and location of the road by transport authorities and police.
- **No more deathtrap cars:** get the unsafe vehicles off the roads and commit to a global vehicle safety standard.
- **There is no planet B:** we need safe and sustainable transport systems to combat the climate crisis. Let us breathe!
- **Lawss:** we need good helmet and seatbelt laws, laws that protect children in the back seat and have zero tolerance for drugs, alcohol, and distractions. We need the political will to enforce these laws.
- **That every second count:** Postcrash care saves lives. We demand a quick and efficient response when the worst happens and justice for road traffic victims.
- **Stop blaming us and start engaging us:** It’s time to change your perception of youth. No more manipulation, decoration or participation for show. We want our needs, ideas, skills and opinions taken into account. Use our boundless potential.

We call on decision-makers and all stakeholders to invest in a Global Youth Coalition for Road Safety to take the movement forward and enact these demands and commitments. We, the Youth, must also be part of the road safety revolution. So we decided to act.

**WHAT WE’LL BE**

We, the Youth of the World, commit to the evidence-based solutions that will save lives and act as role models for safe road behaviour to be the change we would like to see. We know that road safety is a facilitator of many SDGs:

- **SDG 3 Health:**
  - Advocating for better road safety laws and enforcement, quality forms of non-motorized transport and better post-crash care.
  - Calling for a new target to halve road deaths and injuries by 2030.

- **SDG 4 Education:**
  - Raising awareness and campaigning for safe school zones.
  - Promoting peer education on the importance of observing road safety rules.

- **SDG 10 Reduce inequalities:**
  - Petitioning for more meaningful youth representation in road safety decision-making.
  - Fighting for women's rights to move safely and free of prejudices.

- **SDG 11 Sustainable cities and communities:**
  - Advocating to put vulnerable road users first in city design.
  - Pressing local decision-makers to invest in safer and sustainable infrastructure, vehicles and road users.

- **SDG 13 Climate action:**
  - Advocating for safe and sustainable transport that is clean and green.

It’s time for real action, no more false promises or fake commitments. You have to pick a lane: will you work with us to save lives and create a healthier world? Or will you confess to your children in 2030 that you did nothing to stop this global road safety crisis?

We are the Youth of the World, we are here today, these are our demands, these are our commitments.

We are #CLAIMINGOURSPACE.
European regional status report on road safety 2019

The 4th Global Status Report Study estimated that more than 80,000 people were killed from road-traffic injuries in the WHO European Region in 2016, representing 6% of road-traffic deaths worldwide. Decreasing by 13% between 2010 and 2016, the WHO European and Western Pacific regions are the only WHO regions to show reductions in road-traffic mortality since the global community adopted the visionary but ambitious United Nations Sustainable Development Goal (SDG) target to “halve the number of road traffic death and injuries by 2020”. Reductions in mortality have been achieved despite 14% growth in the number of registered vehicles. While the European Region has the lowest road-traffic mortality rate of any WHO region (8.8 deaths per 100,000 population compared to 18.2 per 100,000 globally), wide variation continues to persist, with a seven-fold difference between countries with the highest and lowest road-traffic mortality rates. Should the fall in the number of deaths continue at its current pace, SDG target 3.6 will not be met. This report assesses the laws and practices on key risk factors, such as regulating speed appropriate to road type, drink–driving, and use of seat belts, motorcycle helmets and child restraints to reduce the risk of road-traffic injury.
