Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 13 of 2020 and week 13 of 2021 are presented in the table below. Influenza A and B are co-circulating, and the majority of cases that had been reported were Influenza B between week 52 2020 and week 12 2021. The number of cases reported to FluNet dropped to less than 20 on week 13 (Figure 1) and caution should be taken when interpreting these data as there may be reporting delays.

*Data available for 2020

Figure 1: Number of specimens positive for influenza by subtype, Western Pacific Region, week 15 2020 to week 13 2021 (Source: WHO FLUNET)
Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity continues to be lower than in previous seasons.

Outpatient ILI Surveillance

China (North)
During week 12 of 2021, the percentage of visits for ILI at national sentinel hospitals in Northern China was 2.1%, higher than the last week (2.0%), lower than the same week of 2018 to 2020 (2.7%, 3.6% and 2.4%) (Figure 2).

Mongolia
During week 11 of 2021, ILI activity in Mongolia has been decreased and remains lower than 20 cases per 10,000 population and below the lower tolerance limit (Figure 3).
**Republic of Korea**

In week 13 of 2021, the overall weekly ILI rate was 2.2 ILI cases per 1,000 outpatient visits, higher than the previous week (2.0 ILI cases per 1,000 outpatient visits) but it remains within the observed range for previous season. The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) since week 10 of 2020 (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2021](Source: Korean Centre for Disease Control and Prevention)

**Sentinel influenza surveillance**

**Japan**

In week 11 of 2021, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases this year is not inline with usual trends and is much lower than the previous years (Figure 5).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2011-2021](Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

ILI and influenza activity continued to be lower than previous seasons in most of the countries and areas in the tropical zone.

Surveillance

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 13 of 2021, the average consultation rate for ILI among sentinel general outpatient clinics was 0.4 ILI cases per 1,000 consultations, which was lower than 0.5 ILI cases per 1,000 consultations recorded in the previous week and also lower than the previous two years (Figure 6). The average consultation rate for ILI among sentinel private medical practitioners was 14.3 ILI cases per 1,000 consultations, which was higher than 6.2 recorded in the previous week (Figure 7).

**China (South) - ILI Surveillance**

During Week 12 of 2021, the percentage of visits for ILI at national sentinel hospitals in Southern China was 2.9%, higher than the previous week (2.8%), lower than the same week of 2018 to 2019 (3.6% and 4.1%), higher than the same week of 2020(2.7%) (Figure 8).

**Singapore – Acute Respiratory Infection (ARI) Surveillance**

In Week 12 of 2021, the average daily number of patients seeking treatment in polyclinics for ARI was 1,214 over 5.5 working days, which is significantly lower than the same time period in 2020 (Figure 9). 

The overall positivity rate for influenza among ILI samples (n=301) in the community was 0.0% in the past 4 weeks.
**Lao PDR**

In Week 12 of 2021, the proportion of ILI cases presenting to sentinel sites decreased compared to the previous week. There is some fluctuation in the trend of 2021, but it remains lower compared to the range of 3-year average for past three weeks (Figure 10).

![Figure 10: Weekly proportion of ILI presentations at sentinel sites for 2021 compared to 3 years average (2018 to 2020)](source: Lao National Center for Laboratory and Epidemiology)

**Cambodia**

In week 13 of 2021, the number of ILI cases reported weekly by seven sentinel outpatient sites remained low in Cambodia. The number of cases has remained relatively stable after a second peak in positivity rate seen in week 40 2020 (65.2%). In week 13, 2021, there were no positive specimens and the positivity rate remains very low since week 45 2020. (Figure 11).

![Figure 11: Number of ILI cases at 7 sentinel sites and influenza positivity rate by week, 2020-2021, Cambodia](source: Communicable Disease Control Department, Cambodia Ministry of Health)
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza and ILI (No update)**

In 2020, the average ILI consultation rate at sentinel general practitioners for the seasonal period was 1.6 per 1000 consultations, four times lower than the five year average for the same period (8.1 per 1000 Consultations) (Figure 12).

![Figure 12: ILI presentations to sentinel general practitioners, by week, 2020, 2015-2020 Australia](Source: National Notifiable Diseases Surveillance System, Australian Department of Health)

**New Zealand – Influenza like Illness (No update)**

General Practice-based ILI surveillance methods have changed in 2020 due to the COVID-19 response, limiting interpretability for influenza ILI surveillance. Collection of specimens commenced on 2nd June 2020 and stopped on 27 September 2020. In this period, there were 230 specimens collected from patients presenting to general practices with ILI symptoms, 0 (0%) of which were influenza positive. For the same period in the previous year, 1,617 specimens were tested, 919 (56.8%) of which were influenza positive. (Source)
Pacific Island Countries and Areas (PICs) - ILI Surveillance

In the Pacific Island Countries and Areas, in week 12 of 2021, ILI cases remained low. There is an increasing ILI trend in Fiji, Niue, Samoa and Wallis & Futuna (Figure 13).

(Source: PacNet bulletin)

* Caution should be taken in interpreting these data as there may be changes in number of sentinel sites reporting to the Pacific Syndromic Surveillance System.
