Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 46 of 2022 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 1 to week 46 of 2022 have been Influenza A (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)

During week 46 of 2022, sentinel hospitals in the northern provinces reported an ILI% of 2.1%, higher than the previous week's level of 2.0% and lower than the same week in 2021 (2.8%) , same week in 2020 (2.5%) and same as the same week in 2019 (2.6%). (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in Northern China, 2019-2022](Source: China National Influenza Center)
Mongolia
During week 46 of 2022, the ILI activity in Mongolia decreased to 59 ILI cases per 10,000 population. This is higher than the upper tolerance limit (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2022](Source: Mongolia National Influenza Center)

Republic of Korea
In week 47 of 2022, the overall weekly ILI rate was 13.9 ILI cases per 1,000 outpatient visits, which is higher than the previous week (13.2 per 1,000 outpatients) (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2022](Source: Korean Centres for Disease Control and Prevention)
Sentinel influenza surveillance

**Japan**

In week 45 of 2022, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases in 2022 has been consistently low (Figure 5).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2012-2022](Source: Japan National Institute of Infectious Diseases)

**Countries/areas in the tropical zone**

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**

The latest surveillance data showed that the overall seasonal influenza activity in Hong Kong remained low. In week 47, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPC) was 0.6 ILI cases per 1,000 consultations, which was lower than 0.8 recorded in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 19.8 ILI cases per 1,000 consultations, which was higher than 13.8 recorded in the previous week (Figure 7).

![Figure 7: ILI consultation rates at sentinel private doctors, Hong Kong SAR 2018-2022](Source: Hong Kong Centre for Health Protection)
China (South) - ILI Surveillance
During week 46 of 2022, the percentage of visits for ILI at national sentinel hospitals in Southern China was 3.1%, the same as the last week (3.1%), lower than the same week of 2019-2021 (3.2%, 3.7% and 3.4%). (Figure 8).

Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 46 of 2022, the average daily number of patients seeking treatment in the polyclinics for ARI is 2,184 (over 5.5 working days) (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.5. Of 680 samples tested for influenza in the past four weeks, the positivity rate in the community was 12.6%. Of the 205 specimens tested positive for influenza in October 2022, 194 were positive for Influenza A(H3N2) (95%), 2 were positive for Influenza A(pH1N1) (1%), 2 were positive for Influenza A (LVT) (1%) and 7 were positive for Influenza B (3%) (Figure 10).
Lao PDR
During week 46 of 2022, the National Center for Laboratory and Epidemiology received data from all seven sentinel sites in Lao PDR. The number of ILI cases presenting at sentinel sites was 27 cases higher than the previous week. There were 100 samples tested for influenza in week 46, 2022. All samples tested positive for influenza, including 1 case for Influenza B Victoria and 13 cases for Flu A/H3 (Figure 11).

Cambodia
In week 46 of 2022, Ministry of Health received data from all seven-sentinel sites in Cambodia. The number of ILI cases in Cambodia slightly increased in week 46 of 2022 (110 cases) compared to week 45 of 2022 (86 cases). The influenza positivity rate decreased in week 46 of 2022 (50.00%). The influenza positivity rate in week 45 was 70.00% (Figure 12).
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

In the year to date (until 7 November 2022), there have been 226,527 notifications reported to the National Notifiable Diseases Surveillance System (NNDSS) in Australia. Of these, 771 notifications had a diagnosis date in the latest reported fortnight (17-30 October 2022). This is higher than the number of notifications with a diagnosis date in the previous fortnight (n=748). At the end of the influenza season (May to October), the weekly number of notifications of laboratory-confirmed influenza in 2022 remained below the weekly 5 year average since mid-July (Figure 13).

![Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2017 to 2022 in Australia](Source: National Notifiable Diseases Surveillance System, Australian Department of Health)

**New Zealand – Influenza like Illness**

In the fortnight to 11 November 2022, influenza like illness (ILI) general practitioner consultation rate fluctuated but overall declined (Figure 14). GP consultation rates remain lower than the historical rate for this time of year. Rates were highest in Counties Manukau, which were higher than observed historically, though showed a decrease throughout the month.

![Figure 14: Weekly rates of general practice ILI consultations per 100,000 people in New Zealand in 2020-2022](Source: New Zealand Institute of Environmental Science and Research)
Pacific Island Countries and Areas (PICs) - ILI Surveillance

In week 46 of 2022, 14 out of 18 PICs reported ILI surveillance data. The following countries reported increased influenza-like illness activity, compared with 2019–2021 trends: Fiji, Marshall Islands, Solomon Islands, Vanuatu, Wallis & Futuna. (Figure 15).
